DIRECTORATE OF EDUCATION
GOVT. OF NCT OF DELHI

Support Material
(2015-2016)

CLASS : XI

PHYSICS

Under the Guidance of:

Ms. Punya Salila Srivastava
Secretary (Education)

Ms. Padmini Singla
Director (Education)

Dr. Sunita Shukla Kaushik
Addl. DE (School & Exam)

Coordinators :

Ms. Savita Drall
DDE (Exam)

Ms. Sharda Taneja
OSD (Exam)

Dr. Satish Kumar
OSD (Exam)
Production Team

Anil Kumar Sharma
PREFACE

It gives me immense pleasure to present before you the subject-wise supporting material for the students of classes X, XI and XII, prepared by the teams of dedicated and industrious teachers from the Directorate of Education. The objective of this material is impart sufficient practice to the students and to enable them to think analytically and rationally.

I hope that the students will find this study material useful and it will help them achieve academic excellence. I also hope that teachers will guide and motivate the students to use this material in preparing for examinations.

I would like to appreciate the efforts of the teams of teachers and group leaders under the enlightened guidance of the Director (Education).

Wishing best of luck to all the students.

(PUNYA SALILA SRIVASTAVA)
PREFACE

The Directorate of Education prepares Support Material for different subjects indigenously. Every year, experienced and knowledgeable teachers revise and update the material for children.

Support material is a boon especially for those children who cannot purchase the costly but substandard ‘guides’ available in the market. Prepared in-house, the material is not only much better in quality, it is also provided to the students free of cost.

The material can serves as a very handy tool for revision. I call upon the teachers give their students sufficient practice in it.

I must share with the students that this material has the potential to enhance you performance and output, remarkably. So, please make it a habit to go through the text book first and then, practise from the Support Material.

I take this opportunity to thank all the learned teachers and HoSs who have contributed to the preparation/revision these works.

My best wishes!

(PADMINI SINGLA)
FOREWORD

I am delighted to present before you the latest issues of the support material for the students of classes X, XI and XII. During the last few years the content and quality of the support material has undergone subtle changes. Teams of subject experts have devoted their time, efforts and energy to prepare this material which facilitates the students while preparing for their exams. The material is updated according to the latest changes and improvements which have been carried out by the CBSE and NCERT.

I hope that our teachers will give sufficient practice to their students through this material which in turn will improve their creative and analytical skills.

I appreciate the hard work of all the teachers, group leaders and members of the Examination Branch whose efforts have materialized in the form of these books.

I wish you all the best.

Dr. Sunita S. Kaushik
Addl. Director of Education
(School and Exam)

Unit I : Physical World and Measurement 10 Periods

Chapter-1 : Physical World

Physics-scope and excitement; nature of physical laws; Physics, technology and society.

Chapter-2: Units and Measurements

Need for measurement : Units of measurement; systems of units; SI units, fundamental and derived units. Length, mass and time measurements; accuracy and precision of measuring instruments; errors in measurement; significant figures.

Dimensions of physical quantities, dimensional analysis and its applications.

Unit II: Kinematics 24 Periods

Chapter-3 : Motion in a Straight Line

Frame of reference, Motion in a straight line : Position-time graph, speed and velocity.

Elementary concepts of differentiation and integration for describing motion, uniform and non-uniform motion, average speed and instantaneous velocity, uniformly accelerated motion, velocity - time and position-time graphs.

Relations for uniformly accelerated motion (graphical treatment).

Chapter-4: Motion in a Plane

Scalar and vector quantities; position and displacement vectors, general vectors and their notations; equality of vectors, multiplication of vectors by a real number; addition and subtraction of vectors, relative velocity, Unit vector; resolution of a vector in a plane, rectangular components, Scalar and Vector product of vectors.

Motion in a plane, cases of uniform velocity and uniform acceleration-projectile motion, uniform circular motion.
Unit III: Laws of Motion 14 Periods

Chapter-5: Laws of Motion

Intuitive concept of force, Inertia, Newton’s first law of motion; momentum and Newton’s second law of motion; impulse; Newton’s third law of motion.

Law of conservation of linear momentum and its applications.

Equilibrium of concurrent forces, Static and kinetic friction, laws of friction, rolling friction, lubrication.

Dynamics of uniform circular motion: Centripetal force, examples of circular motion (vehicle on a level circular road, vehicle on a banked road).

Unit IV: Work, Energy and Power 12 Periods

Chapter-6: Work, Energy and Power

Work done by a constant force and a variable force; kinetic energy, work-energy theorem, power.

Notion of potential energy, potential energy of a spring, conservative forces: conservation of mechanical energy (kinetic and potential energies); non-conservative forces: motion in a vertical circle; elastic and inelastic collisions in one and two dimensions.

Unit V: Motion of System of Particles and Rigid Body 18 Periods

Chapter-7: System of Particles and Rotational Motion

Centre of mass of a two-particle system, momentum conservation and centre of mass motion.

Centre of mass of a rigid body; centre of mass of a uniform rod.

Moment of a force, torque, angular momentum, laws of conservation of angular momentum and its applications.

Equilibrium of rigid bodies, rigid body rotation and equations of rotational motion, comparison of linear and rotational motions.
Moment of inertia, radius of gyration, values of moments of inertia for simple geometrical objects (no derivation). Statement of parallel and perpendicular axes theorems and their applications.

Unit VI: Gravitation 12 Periods

Chapter-8: Gravitation

Kepler's laws of planetary motion, universal law of gravitation.

Acceleration due to gravity and its variation with altitude and depth.

Gravitational potential energy and gravitational potential, escape velocity, orbital velocity of a satellite, Geo-stationary satellites.

Unit VII: Properties of Bulk Matter 24 Periods

Chapter-9: Mechanical Properties of Solids

Elastic behaviour, Stress-strain relationship, Hooke's law, Young's modulus, bulk modulus, shear modulus of rigidity, Poisson's ratio; elastic energy.

Chapter-10: Mechanical Properties of Fluids

Pressure due to a fluid column; Pascal's law and its applications (hydraulic lift and hydraulic brakes), effect of gravity on fluid pressure.

Viscosity, Stokes' law, terminal velocity, streamline and turbulent flow, critical velocity, Bernoulli's theorem and its applications.

Surface energy and surface tension, angle of contact, excess of pressure across a curved surface, application of surface tension ideas to drops, bubbles and capillary rise.

Chapter-11: Thermal Properties of Matter

Heat, temperature, thermal expansion; thermal expansion of solids, liquids and gases, anomalous expansion of water; specific heat capacity; \( \text{Cp, Cv} \) - calorimetry; change of state, latent heat capacity.

Heat transfer-conduction, convection and radiation, thermal conductivity, qualitative ideas of Blackbody radiation, Wein's displacement Law, Stefan's law, Greenhouse effect.
Unit VIII: Thermodynamics 12 Periods

Chapter-12: Thermodynamics

Thermal equilibrium and definition of temperature (zeroth law of thermodynamics), heat, work and internal energy. First law of thermodynamics, isothermal and adiabatic processes.

Unit IX: Behaviour of Perfect Gases and Kinetic Theory of Gases 08 Periods

Chapter-13: Kinetic Theory

Equation of state of a perfect gas, work done in compressing a gas.

Kinetic theory of gases - assumptions, concept of pressure. Kinetic interpretation of temperature; rms speed of gas molecules; degrees of freedom, law of equi-partition of energy (statement only) and application to specific heat capacities of gases; concept of mean free path, Avogadro's number.

Unit X: Oscillations and Waves 26 Periods

Chapter-14: Oscillations

Periodic motion - time period, frequency, displacement as a function of time, periodic functions.

Simple harmonic motion (S.H.M) and its equation; phase; oscillations of a spring-restoring force and force constant; energy in S.H.M. Kinetic and potential energies; simple pendulum derivation of expression for its time period.

Free, forced and damped oscillations (qualitative ideas only), resonance.

Chapter-15: Waves

Wave motion: Transverse and longitudinal waves, speed of wave motion, displacement relation for a progressive wave, principle of superposition of waves, reflection of waves, standing waves in strings and organ pipes, fundamental mode and harmonics, Beats, Doppler effect.

1. Internal Choice: There is no overall choice in the paper. However, there is an internal choice in one question of 2 marks weightage, one question of 3 marks weightage and all the three questions of 5 marks weightage.

2. The above template is only a sample. Suitable internal variations may be made for generating similar templates keeping the overall weightage to different form of questions and typology of questions same.
DIMENSIONS AND MEASUREMENT

1.1 Physical Quantity

A quantity which can be measured and expressed in form of laws is called a physical quantity. Physical quantity \(Q = \text{Magnitude} \times \text{Unit} = n \times u\)

Where, \(n\) represents the numerical value and \(u\) represents the unit. As the unit changes, the magnitude \(n\) will also change but product \(nu\) will remain same.

\[i.e. \ n \ u = \text{constant, or } n_1u_1 = n_2u_2 = \text{constant;}\]

1.2 Fundamental and Derived Units

Any unit of mass, length and time in mechanics is called a fundamental, absolute or base unit. Other units which can be expressed in terms of fundamental units, are called derived units.

**System of units:** A complete set of units, both fundamental and derived for all kinds of physical quantities is called system of units.

1. (1) CGS system (2) MKS system (3) FPS system.

(4) **S.I. system:** It is known as International system of units. There are seven fundamental quantities in this system. These quantities and their units are given in the following table.

<table>
<thead>
<tr>
<th>Quantity</th>
<th>Name of Unit</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>Metre</td>
<td>(m)</td>
</tr>
<tr>
<td>Mass</td>
<td>Kilogram</td>
<td>(Kg)</td>
</tr>
<tr>
<td>Time</td>
<td>Second</td>
<td>(s)</td>
</tr>
<tr>
<td>Electric Current</td>
<td>Ampere</td>
<td>(A)</td>
</tr>
</tbody>
</table>

[Class XI : Physics] 10
Besides the above seven fundamental units two supplementary units are also defined - Radian (rad) for plane angle and Steradian (sr) for solid angle.

### 1.3 Dimensions of a Physical Quantity

When a derived quantity is expressed in terms of fundamental quantities, it is written as a product of different powers of the fundamental quantities. The powers to which fundamental quantities must be raised in order to express the given physical quantity are called its dimensions.

### 1.4 Important Dimensions of Complete Physics

**Mechanics**

</tbody>
</table>

1.6 Application of Dimensional Analysis.

1. To find the unit of a physical quantity in a given system of units.

2. To find dimensions of physical constant or coefficients.

3. To convert a physical quantity from one system to the other.

4. To check the dimensional correctness of a given physical relation: This is based on the ‘principle of homogeneity’. According to this principle the dimensions of each term on both sides of an equation must be the same.

5. To derive new relations.
1.7 Limitations of Dimensional Analysis.

(1) If dimensions are given, physical quantity may not be unique.

(2) Numerical constant having no dimensions cannot be deduced by the methods of dimensions.

(3) The method of dimensions cannot be used to derive relations other than product of power functions. For example,

\[ s = u t + \frac{1}{2}a t^2 \quad \text{or} \quad y = a \sin \omega t \]

(4) The method of dimensions cannot be applied to derive formula consist of more than 3 physical quantities.

1.8 Significant Figures.

Significant figures in the measured value of a physical quantity tell the number of digits in which we have confidence. Larger the number of significant figures obtained in a measurement, greater is the accuracy of the measurement. The reverse is also true.

The following rules are observed in counting the number of significant figures in a given measured quantity.

(1) All non-zero digits are significant.

(2) A zero becomes significant figure if it appears between two non-zero digits.

(3) Leading zeros or the zeros placed to the left of the number are never significant.

Example: 0.543 has three significant figures.

Example: 0.006 has one significant figures.

(4) Trailing zeros or the zeros placed to the right of the number are significant.

Example: 4.330 has four significant figures.

Example: 343.000 has six significant figures.

(5) In exponential notation, the numerical portion gives the number of significant figures.

Example: $1.32 \times 10^{-2}$ has three significant figures.
1.9 Rounding Off

(1) If the digit to be dropped is less than 5, then the preceding digit is left unchanged.

*Example:* \( x = 7.82 \) is rounded off to 7.8, again \( x - 3.94 \) is rounded off to 3.9.

(2) If the digit to be dropped is more than 5, then the preceding digit is raised by one.

*Example:* \( x = 6.87 \) is rounded off to 6.9, again \( x = 12.78 \) is rounded off to 12.8.

(3) If the digit to be dropped is 5 followed by digits other than zero, then the preceding digit is raised by one.

*Example:* \( x = 16.351 \) is rounded off to 16.4, again \( x = 6.758 \) is rounded off to 6.8.

(4) If digit to be dropped is 5 or 5 followed by zeros, then preceding digit is left unchanged, if it is even.

*Example:* \( x = 3.250 \) becomes 3.2 on rounding off, again \( x = 12.650 \) becomes 12.6 on rounding off.

(5) If digit to be dropped is 5 or 5 followed by zeros, then the preceding digit is raised by one, if it is odd.

*Example:* \( x = 3.750 \) is rounded off to 3.8, again \( x = 16.150 \) is rounded off to 16.2.

1.10 Significant Figures in Calculation.

The following two rules should be followed to obtain the proper number of significant figures in any calculation.

(1) The result of an addition or subtraction in the number having different precisions should be reported to the same number of decimal places as are present in the number having the least number of decimal places.

(2) The answer to a multiplication or division is rounded off to the same number of significant figures as is possessed by the least precise term used in the calculation.
1.11 Order of Magnitude.

Order of magnitude of quantity is the power of 10 required to represent the quantity. For determining this power, the value of the quantity has to be rounded off. While rounding off, we ignore the last digit which is less than 5. If the last digit is 5 or more than five, the preceding digit is increased by one. For example,

(1) Speed of light in vacuum = \(3 \times 10^8\) ms\(^{-1}\) \(\approx\) \(10^8\) m/s (ignoring \(3 < 5\))

(2) Mass of electron = \(9.1 \times 10^{-31}\) kg \(10^{-30}\) kg (as \(9.1 > 5\)).

1.12 Errors of Measurement.

The measured value of a quantity is always somewhat different from its actual value, or true value. This difference in the true value of a quantity is called error of measurement.

(1) **Absolute error:** Absolute error in the measurement of a physical quantity is the magnitude of the difference between the true value and the measured value of the quantity.

Let a physical quantity be measured \(n\) times. Let the measured value be \(a_1, a_2, a_3, \ldots a_n\). The arithmetic mean of these value is \(a_m = \frac{a_1 + a_2 + \ldots + a_n}{n}\)

Usually, \(a_m\) is taken as the true value of the quantity, if the same is unknown otherwise.

By definition, absolute errors in the measured values of the quantity are

\[\Delta a_1 = a_m - a_1\]

\[\Delta a_2 = a_m - a_2\]

\[\ldots \ldots \ldots \ldots \ldots \ldots \]

\[\Delta a_n = a_m - a_2\]

The absolute errors may be positive in certain cases and negative in certain other cases.
(2) **Mean absolute error:** It is the arithmetic mean of the magnitudes of absolute errors in all the measurements of the quantity. It is represented by $\Delta a$. Thus

$$
\Delta a = \frac{|\Delta a_1| + |\Delta a_2| + \ldots + |\Delta a_n|}{n}
$$

Hence the final result of measurement may be written as $a = a_m \pm \Delta a$

This implies that any measurement of the quantity is likely to lie between $(a_m - \Delta a)$ and $(a_m + \Delta a)$.

(3) **Relative error or Fractional error:** Relative error or Fractional error

$$
= \frac{\text{mean absolute error}}{\text{mean value}} = \frac{\Delta a}{a_m}
$$

(4) Percentage error: Percentage error $= \frac{\Delta a}{a_m} \times 100\%$

1.13 Propagation of Errors

(1) **Error in sum of the quantities:** Suppose $x = a + b$

Let $\Delta a = \text{absolute error in measurement of } a$

$\Delta b = \text{absolute error in measurement of } b$

$\Delta x = \text{absolute error in calculation of } x \text{ i.e. sum of } a \text{ and } b$.

The maximum absolute error in $x$ is $\Delta x = \pm (\Delta a + \Delta b)$

(2) **Error in difference of the quantities:** Suppose $x = a - b$

The maximum absolute error in $x$ is $\Delta x = \pm (\Delta a + \Delta b)$

(3) **Error in product of quantities:** Suppose $x = a \times b$

The maximum fractional error in $x$ is $\frac{\Delta x}{x} = \pm \left( \frac{\Delta a}{a} + \frac{\Delta b}{b} \right)$
(4) **Error in division of quantities:** Suppose \( x = \frac{a}{b} \)

The maximum fractional error in \( x \) is

\[
\frac{\Delta x}{x} = \pm \left( \frac{\Delta a}{a} + \frac{\Delta b}{b} \right)
\]

(5) **Error in quantity raised to some power:** Suppose \( x = \frac{a^n}{b^m} \)

The maximum fractional error in \( x \) is

\[
\frac{\Delta x}{x} = \pm \left( n \frac{\Delta a}{a} + m \frac{\Delta b}{b} \right)
\]

- The quantity which have maximum power must be measured carefully because it’s contribution to error is maximum.

---

**UNIT I - UNITS & MEASUREMENT**

Q1. A New unit of length is chosen such that the speed of light in vacuum is unity. What is the distance between the sun and the earth in terms of the new unit if light takes 8 min and 20 s to cover this distance.

Q2. If \( x = a + bt + ct^2 \), where \( x \) is in metre and in seconds, what is the unit of \( c \)?

Q3. What is the difference between mN, Nm and nm ?

Q4. The radius of atom is of the order of 1\( \text{Å} \) & radius of Nucleus is of the order of fermi. How many magnitudes higher is the volume of the atom as compared to the volume of nucleus ?

Q5. How many kg make 1 unified atomic mass unit?

Q6. Name same physical quantities that have same dimension.

Q7. Name the physical quantities that have dimensional formula \( [\text{ML}^{-1} \text{T}^{-2}] \)

Q8. Give two examples of dimension less variables.

Q9. State the number of significant figures in

\[
\begin{align*}
\text{(i)} & \quad 0.007\text{m}^2 & \text{(ii)} & \quad 2.64 \times 10^{24} \text{kg} \\
\text{(iii)} & \quad 0.2370 \text{ g cm}^{-3} & \text{(iv)} & \quad 0.2300\text{m} \\
\text{(v)} & \quad 86400 & \text{(vi)} & \quad 86400 \text{ m}
\end{align*}
\]
Q10. Given relative error in the measurement of length is .02, what is the percentage error?

Q11. A physical quantity $P$ is related to four observables $a$, $b$, $c$ and $d$ as follows:

$$P = \frac{a^3b^2}{(\sqrt{cd})}$$

The percentage errors of measurement in $a$, $b$, $c$ and $d$ are 1%, 3%, 4% and 2% respectively. What is the percentage error in the quantity $P$? What is the value of $P$ calculated using the above relation turns out to be 3.763, to value should you round off the result?

Q12. A boy recalls the relation for relativistic mass $(m)$ in terms of rest mass $(m_0)$, velocity of particle $v$, but forgets to put the constant $c$ (velocity of light). He writes $m = \frac{m_0}{(1 - v^2)^{1/2}}$ correct the equation by putting the missing ‘c’.

Q13. Name the technique used in locating.

(a) an under water obstacle

(b) position of an aeroplane in space.

Q14. Deduce dimensional formulae of—

(i) Boltzmann’s constant

(ii) mechanical equivalent of heat.

Q15. Give examples of dimensional constants and dimensionless constants.

**SHORT ANSWER QUESTIONS (2 MARKS)**

Q16. The vernier scale of a travelling microscope has 5 divisions which coincide with 49 main scale divisions. If each main scale division is 0.5 mm, Calculate the minimum inaccuracy in the measurement of distance.

Q17. If the unit of force is 100N, unit of length is 10m and unit of time is 100s. What is the unit of Mass in this system of units?

Q18. Describe the principle and use of SONAR and RADAR.
Q19. State the principle of homogeneity. Test the dimensional homogeneity of equations—

(i) \[ S = ut + \frac{1}{2}at^2 \]

(ii) \[ S_n = u + \frac{a}{2}(2n - 1) \]

Q20. In van der Wall’s gas equation \( P + \frac{a}{v^2} (v - b) = RT \). Determine the dimensions of \( a \) and \( b \).

Q21. Using dimensions convert (a) 1 newton into dynes (b) 1 erg into joules.

Q22. Magnitude of force experienced by an object moving with speed \( v \) is given by \( F = kv^2 \). Find dimensions of \( k \).

Q23. A book with printing error contains four different formulae for displacement. Choose the correct formula/formulae

(a) \( y = a \sin \frac{2\pi}{T} t \)  
(b) \( y = a \sin vt \)

(c) \( y = \frac{a}{T} \sin \left( \frac{t}{a} \right) \)  
(d) \( y = \frac{a}{T} \left( \sin \frac{2\pi}{T} t + \cos \frac{2\pi}{T} t \right) \)

Q24. Give limitations of dimensional analysis.

Q25. For determination of ‘\( g \)’ using simple pendulum, measurements of length and time period are required. Error in the measurement of which quantity will have larger effect on the value of ‘\( g \)’ thus obtained. What is done to minimise this error?

**SHORT ANSWER QUESTIONS (3 MARKS)**

Q26. Give the name of six Indian Scientists and their discoveries.

Q27. Name the discoveries made by the following scientists:

(a) Faraday  
(b) Chadwick
Q28. Name the scientific principle on which the following technology is based.

- Steam engine
- Laser
- Aeroplane
- Rocket propulsion
- Radio and T.V.
- Production of Ultra high magnetic field.

Q29. Describe a method for measuring the molecular size of Oleic acid.

[3 MARKS]

Q30. Describe the Parallax Method for the determination of the distance of a nearby star from the earth.

Q31. Deduce the dimensional formula for the following quantities

- Gravitational constant
- Young’s modules
- Coefficient of viscosity.

Q32. Define the following units:

- Light year
- Parsec
- Astronomical unit (Au)

LONG ANSWER QUESTIONS (5 MARKS)

Q33. Name the four basic forces in nature. Write a brief note of each. Hence compare their strengths and ranges.

Q34. Distinguish between the terms precision and accuracy of a measurement.

Q35. Explain

- Absolute error
- Mean absolute error
- Relative error
- Percentage error
- Random error
NUMERICALS

Q36. Determine the number of light years in one metre.

Q37. The sides of a rectangle are $(10.5 \pm 0.2)$ cm and $(5.2 \pm 0.1)$ cm. Calculate its perimeter with error limits.

Q38. The mass of a box measured by a grocer’s balance is 2.3 kg. Two gold pieces 20.15 g and 20.17 g are added to the box.

(i) What is the total mass of the box?

(ii) The difference in masses of the pieces to correct significant figures.

Q39. 5.74 g of a substance occupies $1.2 \text{ cm}^3$. Express its density to correct significant figures.

Q40. If displacement of a body $s = (200 \pm 5)$ m and time taken by it $t = (20 + 0.2)$ s, then find the percentage error in the calculation of velocity.

Q41. If the error in measurement of mass of a body be 3% and in the measurement of velocity be 2%. What will be maximum possible error in calculation of kinetic energy.

Q42. The length of a rod as measured in an experiment was found to be 2.48m, 2.46m, 2.49m, 2.50m and 2.48m. Find the average length, absolute error and percentage error. Express the result with error limit.

Q43. A physical quantity is measured as $Q = (2.1 \pm 0.5)$ units. Calculate the percentage error in (i) $Q^2$ (ii) $2Q$.

Q44. When the planet Jupiter is at a distance of 824.7 million km from the earth, its angular diameter is measured to be 35.72” of arc. Calculate diameter of Jupiter.

Q45. A laser light beamed at the moon takes 2.56s and to return after reflection at the moon’s surface. What will be the radius of lunar orbit.

Q46. Convert

(i) $3 \text{ m} \cdot \text{s}^{-2}$ to km $\text{h}^{-2}$

(ii) $G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$ to cm$^3$ g$^{-1}$ s$^{-2}$
Q47. A calorie is a unit of heat or energy and it equals 4.2 J where 1J = 1kg m²s⁻². Suppose we employ a system of units in which unit of mass is α kg, unit of length is β m, unit of time is γs. What will be magnitude of calorie in terms of this new system.

Q48. The escape velocity v of a body depends on-
   (i) the acceleration due to gravity ‘g’ of the planet,
   (ii) the radius R of the planet. Establish dimensionally the relation for the escape velocity.

Q49. The frequency of vibration of a string depends on, (i) tension in the string (ii) mass per unit length of string, (iii) vibrating length of the string. Establish dimensionally the relation for frequency.

Q50. One mole of an ideal gas at STP occupies 22.4 L. What is the ratio of molar volume to atomic volume of a mole of hydrogen? Why is the ratio so large. Take radius of hydrogen molecule to be 1⁵/₂⁴Å.

SOLUTIONS

Ans 1. Speed of high in vacuum, c = 1 new unit of length s⁻¹
   
   t = 8 min. 20 sec. = 500 s
   
   x = ct = 1 New unit of length s⁻¹ × 500s
   
   x = 500 New unit of Length

Ans 2. The unit of left hand side is metre so the units of ct² should also be metre. Since t² has unit of s², so the unit of c is m/s².

Ans 3. mN means milli newton, 1 mN = 10⁻³ N, Nm means Newton meter, nm means nano meter.

Ans 4. \[
\frac{V_{atom}}{V_{nucleus}} = \frac{4\pi(10^{-10} m)^3}{4\pi(10^{-13} m)^3} = 10^{13}
\]

Ans 5. 1u = 1.66 × 10⁻²⁷ kg

Ans 6. Work, energy and torque.
Ans 7. Stress, pressure, modulus of elasticity.

Ans 8. Strain, refractive index.

Ans 9. (i) 1, (ii) 3, (iii) 4, (iv) 4, (v) 3, (vi) 5 since it comes from a measurement the last two zeros become significant.

Ans 10. 2%

Ans 11. Relative error in $P$ is given by

$$\frac{\Delta P}{P} = 3 \frac{\Delta a}{a} + 2 \frac{\Delta b}{b} + \frac{1}{2} \frac{\Delta c}{c} + \frac{\Delta d}{d}$$

So, percentage error

$$\frac{\Delta P}{P} \times 100 = 3 \left( \frac{\Delta a}{a} \times 100 \right) + 2 \left( \frac{\Delta b}{b} \times 100 \right) + \frac{1}{2} \left( \frac{\Delta c}{c} \times 100 \right) + \frac{\Delta d}{d} \times 100$$

$$= (3 \times 1\%) + (2 \times 3\%) + \left( \frac{1}{2} \times 4\% \right) + (1 \times 2\%)$$

$$= 13\%$$

Ans 12. Since quantities of similar nature can only be added or subtracted, $v^2$ cannot be subtracted from 1 but $v^2/c^2$ can be subtracted from 1.

$$m = \frac{m_n}{\sqrt{1 - v^2 / c^2}}$$

Ans 13. (a) SONAR → Sound Navigation and Ranging.

(b) RADAR → Radio Detection and Ranging.

Ans 14. (i) Boltzmann Constant :

$$k = \frac{\text{Heat}}{\text{Temperature \Rightarrow [k]} = \frac{ML^2T^{-2}}{K} = M^1L^1T^{-2}K^{-1}$$

(ii) $[J] = \left[ \frac{\text{Work}}{\text{Heat}} \right] = \frac{M^1L^2T^{-2}}{M^1L^1T^{-2}} = [M^0L^0T^0]$
Ans15. Dimensional Constants: Gravitational constant, plank’s constant.

Dimensionless Constants: \( \pi \), e.

Ans16. Minimum inaccuracy = Vernier constant

\[ = 1 \text{ MSD} - 1\text{ VS.D} \]
\[ = 1\text{MSV} - \frac{49}{50}\text{MSD} \]
\[ = \frac{1}{50} (0.5 \text{ mm}) = 0.01 \text{ mm} \]

Ans17. \([F] = [MLT^{-2}]\)

\[ [M] = \frac{[F]}{[L][T^{-1}]} = \frac{[100 \text{ N}]}{[10\text{m}][100\text{s}]} = 10^5\text{kg} \]

Ans19. (i) Dimension of L.H.S. = [s] = \([M^0L^1T^0]\)

Dimension of R.H.S = \([ut] + [at^2] = [LT^{-1}T] + [M^0L^1T^{-2}][T^2] = M^0L^1T^0\)

∴ The equation to dimensionally homogeneous.

(ii) \(S_n = \text{Distance travelled in } n^{\text{th}} \text{ sec that is } (S_n - S_{n-1})\)

∴ \(S_n = u \times t + \frac{a}{2} (2n - 1)\)

\[ [LT^{-1}] = [LT^{-1}] + [LT^{-2}][T] \]

\[ LT^{-1} = [LT^{-1}] \]

L.H.S. = R.H.S.

Hence this is dimensionally correct.

Ans20. Since dimensionally similar quantities can only be added

∴ \([P] = \left| \frac{a}{v^2} \right| \Rightarrow [a] = [Pv^2] = M^1 L^5 T^{-2} \)

\([b] = [v] = L^3 \)
Ans22. \[ [K] = \frac{[F]}{[v^2]} = \frac{M'LT^{-2}}{[LT^{-1}]^2} = \frac{M'LT^{-2}}{M^0L^0T^2} = [M'LT^{-1}] \]

Ans23. The argument of sine and cosine function must be dimensionless so (a) is the probable correct formula. Since

(a) \( y = a \sin \left( \frac{2\pi}{T} t \right) \cdot \left[ \frac{2\pi T}{T} \right] = [T^0] \) is dimensionless.

(b) \( y = a \sin \mu t \because [\mu t] = [L] \) is dimensional so this equation is incorrect.

(c) \( y = \frac{a}{t} \sin \left( \frac{t}{a} \right) \left[ \frac{t}{a} \right] \) is dimensional so this is incorrect.

(d) \( y = \frac{a}{t} \left( \sin \frac{2\pi}{T} t + \cos \frac{2\pi}{T} t \right) : \) Though \( \frac{2\pi}{T} \) dimensionless \( \frac{a}{T} \) does not have dimensions of displacement so this is also incorrect

(NUMERICAL)

Ans36. \( 1 \text{ ly} = 9.46 \times 10^{15} \text{ m} \)

\[ 1 \text{ m} = \frac{1}{9.46 \times 10^{15}} = 1.057 \times 10^{-16} \text{ ly} \]

Ans37. \( P = 2(l + b) \pm 2(\Delta l + \Delta b) \)

\[ = 2(10.5 + 5.2) \pm 2(0.2 + 0.1) \]

\[ = (31.4 \pm 0.6) \text{ cm} \]

Ans38. (i) Mass of box : 2.3 kg

Mass of gold pieces = 20.15 + 20.17 = 40.32 g = 0.04032 kg.

Total mass = 2.3 + 0.04032 = 2.34032 kg

In correct significant figure mass = 2.3 kg (as least decimal)

(ii) Difference in mass of gold pieces = 0.02 g

In correct significant figure (2 significant fig. minimum decimal) will be 0.02 g.
Ans39. Density = \( \frac{\text{Mass}}{\text{Volume}} = \frac{5.74}{1.2} = 4.783 \text{g/cm}^3 \)

Here least significant figure is 2, so density = 4.8 \text{ g/cm}^3

Ans40. Percentage error in measurement of displacement = \( \frac{5}{200} \times 100 \)

Percentage error in measurement of time = \( \frac{0.2}{20} \times 100 \)

\[ \therefore \text{Maximum permissible error} = 2.5 + 1 = 3.5\% \]

Ans41. K.E. = \( \frac{1}{2}mv^2 \)

\[ \Delta k = \frac{\Delta m}{m} + 2\frac{\Delta v}{v} \Rightarrow \frac{\Delta k}{k} \times 100 = \frac{\Delta m}{m} \times 100 + 2\left(\frac{\Delta v}{v}\right) \times 100 \]

\[ \therefore \text{Percentage error in K.E.} = 3\% + 2 \times 2\% = 7\% \]

Ans42. Average length

\[ = \frac{2.48 + 2.46 + 2.49 + 2.50 + 2.48}{5} = \frac{12.41}{5} = 2.48 \text{m} \]

Mean absolute error

\[ = \frac{0.00 + 0.02 + 0.01 + 0.02 + 0.00}{5} = \frac{0.05}{5} = 0.013 \text{m} \]

Percentage error = \( \frac{0.01}{2.48} \times 100\% = 0.4\% \times 100\% \)

\[ = 0.40\% \]

Correct length = (2.48 ± 0.01)\text{m}

Correct length = (2.48 m ± 0.40%)

Ans43. \( P = Q^2 \)

\[ \frac{\Delta p}{p} = \frac{2\Delta Q}{Q} \left(\frac{0.5}{2.1}\right) = \frac{1.0}{2.1} = 0.476 \]
\[ \frac{\Delta p}{p} \times 100\% = 47.6\% = 48\% \]

\[ R = 2Q \]

\[ \frac{\Delta R}{R} = \frac{\Delta Q}{Q} \Rightarrow \frac{0.5}{2.1} = 0.238 \]

\[ \frac{\Delta R}{R} \times 100\% = 24\% \]

Ans 44. \( Q = 35.72'' \)

\[ 1'' = 4.85 \times 10^{-6} \text{ radian} \Rightarrow 35.72 \times 4.85 \times 10^{-6} \]

\[ d = DQ = 824.7 \times 35.72 \times 4.85 \times 10^{-6} \]

\[ = 1.4287 \times 10^{5} \text{ km} \]

Ans 45. \( t = 2.56 \text{ s} \)

\[ \therefore t' = \text{time taken by laser beam to go to the man} = \frac{t}{2} \]

\[ \text{distance between earth and moon} = d = c \times \frac{t}{2} \]

\[ = 3 \times 10^{8} \times \frac{2.56}{2} \]

\[ = 3.84 \times 10^{8} \text{ m} \]

Ans 46. (i) \( 3 \text{ m s}^{-2} = \left( \frac{3}{1000} \text{ km} \right) \left( \frac{1}{60 \times 60} \text{ hr} \right)^{-2} \)

\[ = \frac{3 \times (60 \times 60)^{2}}{1000} = 3.9 \times 10^{4} \text{ km h}^{-2} \]

(ii) \( G = 6.67 \times 10^{-11} \text{ N m}^{2} \text{ kg}^{-2} \)

\[ = 6.67 \times 10^{-11} (\text{kg m s}^{-2}) (\text{m}^{2} \text{ kg}^{-2}) \]
\[ G = 6.67 \times 10^{-11} \text{ kg}^{-1} \text{ m}^3 \text{ s}^{-2} \]
\[ = 6.67 \times 10^{-11} \frac{1}{1000} \frac{1}{100} \times 100 \times 100 \times 100 \]
\[ = 6.67 \times 10^{-8} \text{ g}^{-1} \text{ cm}^3 \text{s}^{-2} \]

A47. \[
\beta = \frac{M_1}{M_2} \left( \frac{L_1}{L_2} \right)^a \left( \frac{T_1}{T_2} \right)^c
\]
\[ = 4.2 \left( \frac{\text{kg}}{\alpha \text{ kg}} \right)^\frac{1}{2} \left( \frac{\text{m}}{\beta \text{ m}} \right)^2 \left( \frac{\text{s}}{\gamma \text{s}} \right)^2
\]
\[ \beta = 4.2 \alpha^{-\frac{1}{2}} \beta^{2} \gamma^{2} \]

A48. \[ \alpha g^a R^b \Rightarrow v = k g^a R^b, K \rightarrow \text{dimensionless proportionality constant} \]

\[ [v] = [g]^a [R]^b \]
\[ [M^0 L^1 T^{-1}] = [M^0 L^1 T^{-2}]^a [M^0 L^1 T^0]^b \]

equating powers
\[ 1 = a + b \]
\[-1 = -2a \Rightarrow a = \frac{1}{2} \]
\[ b = 1 - a = 1 - \frac{1}{2} = \frac{1}{2} \]
\[ \therefore v = k \sqrt{gR} \]

A49. \[ n \alpha \beta \gamma \eta \xi [l] = M^0 L^1 T^0 \]

\[ [T] = M^1 L^1 T^{-2} \text{ (force)} \]
\[ [M] = M^1 L^{-1} T^0 \]
\[ [M^0 L^0 T^{-1}] = [M^0 L^1 T^{0}]^a [M^1 L^1 T^{-2}]^b [M^1 L^{-1} T^0]^c \]
b + c = 0
a + b – c = 0
–2b = –1 b = 1/2
c = \frac{-1}{2} a = 1

\[ n \propto \frac{1}{T} \sqrt{T} \]

A50. \( 1 \text{ A}^0 = 10^{-10} \text{m} \)

Atomic volume of 1 mole of hydrogen = Avagadros number \times\) volume of hydrogen molecule

\[ = 6.023 \times 10^{23} \times \frac{4}{3} \times \pi \times \left(10^{-10} \text{m}\right)^3 \]

\[ = 25.2 \times 10^{-7} \text{m}^3 \]

Molar volume = 22.4 L = 22.4 \times 10^{-3} \text{m}^3

\[ \frac{\text{Molar volume}}{\text{Atomic volume}} = \frac{22.4 \times 10^{-3}}{25.2 \times 10^{-7}} = 0.89 \times 10^4 = 10^4 \]

This ratio is large because actual size of gas molecule is negligible in comparison to the inter molecular separation.
UNIT 2

KINEMATICS

2.1 Motion in One Dimension: Position

Position of any point is completely expressed by two factors: Its distance from the observer and its direction with respect to observer.

That is why position is characterised by a vector known as position vector.

Let point $P$ is in a $xy$ plane and its coordinates are $(x, y)$. Then position vector $\vec{r}$ of point will be $x \hat{i} + y \hat{j}$ and if the point $P$ is in a space and its coordinates are $(x, y, z)$ then position vector can be expressed as $\vec{r} = x \hat{i} + y \hat{j} + z \hat{k}$.

2.2 Rest and Motion.

If a body does not change its position as time passes with respect to frame of reference, it is said to be at rest.

And if a body changes its position as time passes with respect to frame of reference, it is said to be in motion.

Frame of Reference: - It is a system to which a set of coordinates are attached and with reference to which observer describes any event.

Rest and motion are relative terms. It depends upon the frame of references.

2.3 Types of Motion.

<table>
<thead>
<tr>
<th>One dimensional</th>
<th>Two dimensional</th>
<th>Three dimensional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Motion of a body in a straight line is called one dimensional motion.</td>
<td>Motion of body in a plane is called two dimensional motion.</td>
<td>Motion of body in a space is called three dimensional motion.</td>
</tr>
</tbody>
</table>
One dimensional | Two dimensional | Three dimensional
---|---|---
When only one coordinate of the position of a body changes with time then it is said to be moving one dimensionally. | When two coordinates of the position of a body changes with time then it is said to be moving two dimensionally. | When all three coordinates of the position of a body changes with time then it is said to be moving three dimensionally.

e.g.: Motion of car on a straight road. | e.g.: Motion of car on a circular turn. | e.g.: Motion of flying kite.
Motion of freely falling body. | Motion of billiards ball. | Motion of flying insect.

2.4 Distance and Displacement.

(1) **Distance**: It is the actual path length covered by a moving particle in a given interval of time.
   (i) It's a scalar quantity.
   (ii) Dimension: \([M^0 L^1 T^0]\)
   (iii) Unit: metre (S.I.)

(2) **Displacement**: Displacement is the change in position vector \(i.e.,\) A vector joining initial to final position.
   (i) Displacement is a vector quantity
   (ii) Dimension: \([M^0 L^1 T^0]\)
   (iii) Unit: metre (S.I.)
   (iv) If \(\vec{S}_1, \vec{S}_2, \vec{S}_3, \ldots, \vec{S}_n\) are the displacements of a body then the total (net) displacement is the vector sum of the individuals.
   \[
   \vec{S} = \vec{S}_1 + \vec{S}_2 + \vec{S}_3 + \ldots + \vec{S}_n
   \]

(3) **Comparison between distance and displacement**:
   (i) Distance \(\geq\) | Displacement |
   (ii) For a moving particle distance can never be negative or zero while displacement can be. \(i.e.,\) Distance > 0 but Displacement \(> =\) or < 0
   (iii) For motion between two points displacement is single valued while distance depends on actual path and so can have many values.
(iv) For a moving particle distance can never decrease with time while displacement can. Decrease in displacement with time means body is moving towards the initial position.

(v) In general magnitude of displacement is not equal to distance. However, it can be so if the motion is along a straight line without change in direction.

2.5 Speed and Velocity.

(1) **Speed**: Rate of distance covered with time is called speed.

(i) It is a scalar quantity having symbol \( v \).

(ii) Dimension: \([M^0L^1T^{-1}]\)

(iii) Unit: metre/second (S.I), cm/second (C.G.S.)

(iv) Types of speed:

(a) **Uniform speed**: When a particle covers equal distances in equal intervals of time, (no matter how small the intervals are) then it is said to be moving with uniform speed.

(b) **Non-uniform (variable) speed**: In non-uniform speed particle covers unequal distances in equal intervals of time.

(c) **Average speed**: The average speed of a particle for a given ‘Interval of time’ is defined as the ratio of distance travelled to the time taken.

\[
\text{Average speed} = \frac{\text{Distance travelled}}{\text{Time taken}}; v_{av} = \frac{\Delta s}{\Delta t}
\]

- Time average speed: When particle moves with different uniform speed \( v_1, v_2, v_3 \ldots \text{ etc} \) in different time intervals \( t_1, t_2, t_3, \ldots \text{ etc} \) respectively, its average speed over the total time of journey is given as

\[
v_{av} = \frac{\text{Total distance covered}}{\text{Total time elapsed}} = \frac{d_1 + d_2 + d_3 + \ldots}{t_1 + t_2 + t_3 + \ldots} = \frac{u_1t_1 + u_2t_2 + u_3t_3 + \ldots}{t_1 + t_2 + t_3 + \ldots}
\]
Special case: When particle moves with speed $v_1$ up to half time of its total motion and in rest time it is moving with speed $v_2$ then $v_{av} = \frac{v_1 + v_2}{2}$

- **Distance averaged speed**: When a particle describes different distances $d_1, d_2, d_3, \ldots$ with different time intervals $t_1, t_2, t_3, \ldots$ with speeds $v_1, v_2, v_3, \ldots$ respectively then the speed of particle averaged over the total distance can be given as

\[
v_{av} = \frac{\text{Total distance covered}}{\text{Total time elapsed}} = \frac{d_1 + d_2 + d_3 + \ldots}{t_1 + t_2 + t_3 + \ldots} = \frac{d_1}{v_1} + \frac{d_2}{v_2} + \frac{d_3}{v_3} + \ldots
\]

(d) **Instantaneous speed**: It is the speed of a particle at particular instant. When we say “speed”, it usually means instantaneous speed.

The instantaneous speed is average speed for infinitesimally small time interval (i.e., $\Delta t \to 0$). Thus

Instantaneous speed $v = \lim_{\Delta t \to 0} \Delta s/\Delta t = \frac{ds}{dt}$

(2) **Velocity**: Rate of change of position i.e. rate of displacement with time is called velocity.

(i) It is a scalar quantity having symbol $v$.

(ii) Dimension: $[M^0L^1T^{-1}]$

(iii) Unit: metre/second (S.I.), cm/second (C.G.S.)

(iv) Types

(a) **Uniform velocity**: A particle is said to have uniform velocity, if magnitudes as well as direction of its velocity remains same and this is possible only when the particles moves in same straight line without reversing its direction.
(b) **Non-uniform velocity**: A particle is said to have non-uniform velocity, if either of magnitude or direction of velocity changes (or both changes).

(c) **Average velocity**: It is defined as the ratio of displacement to time taken by the body.

\[
\text{Average velocity} = \frac{\text{Displacement}}{\text{Time taken}}; \quad \vec{v}_{av} = \frac{\Delta \vec{r}}{\Delta t}
\]

(d) **Instantaneous velocity**: Instantaneous velocity is defined as rate of change of position vector of particles with time at a certain instant of time.

\[
\text{Instantaneous velocity} \quad \vec{v} = \lim_{t \to 0} \frac{\Delta \vec{r}}{\Delta t} = \frac{d\vec{r}}{dt}
\]

(v) **Comparison between instantaneous speed and instantaneous velocity**

(a) instantaneous velocity is always tangential to the path followed by the particle.

(b) A particle may have constant instantaneous speed but variable instantaneous velocity.

(c) The magnitude of instantaneous velocity is equal to the instantaneous speed.

(d) If a particle is moving with constant velocity then its average velocity and instantaneous velocity are always equal.

(e) If displacement is given as a function of time, then time derivative of displacement will give velocity.

(vi) **Comparison between average speed and average velocity**

(a) Average speed is scalar while average velocity is a vector both having same units \((m/s)\) and dimensions \([LT^{-1}]\).

(b) Average speed or velocity depends on time interval over which it is defined.
(c) For a given time interval average velocity is single valued while average speed can have many values depending on path followed.

(d) If after motion body comes back to its initial position then 
   \[ \dot{v}_{av} = 0 \text{ (as } \Delta \mathbf{r} = 0 \text{) but } v_{av} > 0 \text{ and finite as } (\Delta s > 0). \]

(e) For a moving body average speed can never be negative or zero (unless \( t \rightarrow \infty \)) while average velocity can be \( i.e. \)
   \[ \ddot{v}_{av} > 0 \text{ while } \dot{v}_{av} = 0 < 0. \]

2.6 Acceleration.

The time rate of change of velocity of an object is called acceleration of the object.

(1) It is a vector quantity. It’s direction is same as that of change in velocity (Not of the velocity)

(2) There are three possible ways by which change in velocity may occur

<table>
<thead>
<tr>
<th>When only direction of velocity changes</th>
<th>When only magnitude of velocity changes</th>
<th>When both magnitude and direction of velocity changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acceleration perpendicular to velocity</td>
<td>Acceleration parallel or anti-parallel to velocity</td>
<td>Acceleration has two components one is perpendicular to velocity and another parallel or anti-parallel to velocity</td>
</tr>
<tr>
<td>e.g. Uniform circular motion</td>
<td>e.g. Motion under gravity</td>
<td>e.g. Projectile motion</td>
</tr>
</tbody>
</table>

(3) Dimension: \([M^0L^1T^{-2}]\)

(4) Unit: metre/second\(^2\) (S.I.); cm/second\(^2\) (C.G.S.)

(5) Types of acceleration:

   (i) **Uniform acceleration**: A body is said to have uniform acceleration if magnitude and direction of the acceleration remains constant during particle motion.

       - If a particle is moving with uniform acceleration, this does not necessarily imply that particle is moving in straight line. \( e.g. \) Projectile motion.
(ii) Non-uniform acceleration: A body is said to have non-uniform acceleration, if magnitude or direction or both, change during motion.

(iii) Average acceleration: \( \vec{a}_{av} = \frac{\Delta \vec{v}}{\Delta t} = \frac{\vec{v}_2 - \vec{v}_1}{\Delta t} \)

The direction of average acceleration vector is the direction of the change in velocity vector as \( \vec{a} = \frac{\Delta \vec{v}}{\Delta t} \)

(iv) Instantaneous acceleration = \( \vec{a} = \lim_{\Delta t \to 0} \frac{\Delta \vec{v}}{\Delta t} = \frac{d\vec{v}}{dt} \)

(v) For a moving body there is no relation between the direction of instantaneous velocity and direction of acceleration.

\( e.g. \) (a) In uniform circular motion \( \theta = 90^\circ \) always (b) In a projectile motion \( \theta \) is variable for every point of trajectory.

(vi) By definition \( \vec{a} = \frac{d\vec{v}}{dt} = \frac{d^2 \vec{x}}{dt^2} \left[ \text{As } \vec{v} = \frac{d\vec{x}}{dt} \right] \)

(vii) If velocity is given as a function of position, then by chain rule

\( a = \frac{dv}{dt} = \frac{dv}{dx} \times \frac{dx}{dt} = v \times \frac{dv}{dx} \left[ \text{as } v = \frac{dx}{dt} \right] \)

(viii) If a particle is accelerated for a time \( t_1 \) by acceleration \( a_1 \) and for time \( t_2 \) by acceleration \( a_2 \) then average acceleration is

\( a_{av} = \frac{a_1 t_1 + a_2 t_2}{t_1 + t_2} \)

(ix) Acceleration can be positive, zero or negative. Positive acceleration means velocity increasing with time, zero acceleration means velocity is uniform constant while negative acceleration (retardation) means velocity is decreasing with time.

(x) For motion of a body under gravity, acceleration will be equal to “\( g \)”, where \( g \) is the acceleration due to gravity. Its normal value is 9.8 m/s\(^2\) or 980 cm/s\(^2\) or 32 feet/s\(^2\).
### 2.7 Position Time Graph

**Various position - time graphs and their interpretation**

<table>
<thead>
<tr>
<th>Graph</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Graph" /></td>
<td>( \theta = 0^\circ ) so ( v = 0 )  &lt;br&gt; <em>i.e.</em>, line parallel to time axis represents that the particle is at rest.</td>
</tr>
<tr>
<td><img src="image2.png" alt="Graph" /></td>
<td>( \theta = 90^\circ ) so ( v = \infty )  &lt;br&gt; <em>i.e.</em>, line perpendicular to time axis represents that particle is changing its position but time does not change. It means the particle possesses infinite velocity. Practically this is not possible.</td>
</tr>
<tr>
<td><img src="image3.png" alt="Graph" /></td>
<td>( \theta = \text{constant} ) so ( v = \text{constant}, a = 0 )  &lt;br&gt; <em>i.e.</em>, line with constant slope represents uniform velocity of the particle.</td>
</tr>
<tr>
<td><img src="image4.png" alt="Graph" /></td>
<td>( \theta ) is increasing so ( v ) is increasing, ( a ) is positive  &lt;br&gt; <em>i.e.</em>, line bending towards position axis represents increasing velocity of particle. It means the particle possesses acceleration.</td>
</tr>
<tr>
<td><img src="image5.png" alt="Graph" /></td>
<td>( \theta ) is decreasing so ( v ) is decreasing, ( a ) is negative  &lt;br&gt; <em>i.e.</em>, line bending towards time axis represents decreasing velocity of the particle. It means the particle possesses retardation.</td>
</tr>
<tr>
<td><img src="image6.png" alt="Graph" /></td>
<td>( \theta ) constant but ( &gt; 90^\circ ) so ( v ) will be constant but negative  &lt;br&gt; <em>i.e.</em>, line with negative slope represents that particle returns towards the point of reference, (negative displacement).</td>
</tr>
<tr>
<td><img src="image7.png" alt="Graph" /></td>
<td>Straight line segments of different slopes represent that velocity of the body changes after certain interval of time.</td>
</tr>
</tbody>
</table>
This graph shows that at one instant the particle has two positions. Which is not possible.

The graph shows that particle coming towards origin initially and after that it is moving away from origin.

**Note:**

- If the graph is plotted between distance and time then it is always an increasing curve and it never comes back towards origin because distance never decrease with time.

- For two particles having displacement time graph with slopes $\theta$ and $\bar{\theta}$ possesses velocities $v_1$ and $v_2$ respectively then $\frac{v_1}{v_2} = \frac{\tan \theta_1}{\tan \theta_2}$

### 2.8 Velocity Time Graph.

The graph is plotted by taking time $t$ along $x$ axis and velocity of the particle on $y$ axis.

**Distance and displacement:** The area covered between the velocity time graph and time axis gives the displacement and distance travelled by the body for a given time interval.

Then Total distance = Addition of modulus of different area. *i.e.* $s = \int |v|dt$

Total displacement = Addition of different area considering their sign. *i.e.* $r = \int vdt$

**Acceleration:** It is clear that slope of velocity-time graph represents the acceleration of the particle.
Various velocity - time graphs and their interpretation

<table>
<thead>
<tr>
<th>Graph</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Graph 1](image) | $\theta = 0$, $a = 0$, $v = \text{constant}$  
<i.e., line parallel to time axis represents that the particle is moving with constant velocity. | |
| ![Graph 2](image) | $\theta = 90^\circ$, $a = \infty$, $v = \text{increasing}$  
<i.e., line perpendicular to time axis represents that the particle is increasing its velocity, but time does not change. It means the particle possesses infinite acceleration. Practically it is not possible. | |
| ![Graph 3](image) | $\theta =$constant, so $a =$constant and $v$ is increasing uniformly with time  
<i.e., line with constant slope represents uniform acceleration of the particle. | |
| ![Graph 4](image) | $\theta =$increasing so acceleration increasing  
<i.e., line bending towards velocity axis represent the increasing acceleration in the body. | |
| ![Graph 5](image) | $\theta =$decreasing so acceleration decreasing  
<i.e., line bending towards time axis represents the decreasing acceleration in the body | |
| ![Graph 6](image) | Positive constant acceleration because $\theta$ is constant and $< 90^\circ$ but initial velocity of the particle is negative. | |
| ![Graph 7](image) | Positive constant acceleration because $\theta$ is constant and $< 90^\circ$ but initial velocity of particle is positive. | |
| ![Graph 8](image) | Negative constant acceleration because $\theta$ is constant and $> 90^\circ$ but initial velocity of the particle is positive. | |
| ![Graph 9](image) | Negative constant acceleration because $\theta$ is constant and $> 90^\circ$ but initial velocity of the particle is zero. | |
Negative constant acceleration because \( \theta \) is constant and > 90° but initial velocity of the particle is negative.

2.9 Equations of Kinematics.

These are the various relations between \( u, v, a, t \) and \( s \) for the moving particle where the notations are used as:

- \( u = \) Initial velocity of the particle at time \( t = 0 \) sec
- \( v = \) Final velocity at time \( t \) sec
- \( a = \) Acceleration of the particle
- \( s = \) Distance travelled in time \( t \) sec
- \( s_n = \) Distance travelled by the body in \( n^{th} \) sec

\[(1) \quad \text{When particle moves with constant acceleration}\]

(i) Acceleration is said to be constant when both the magnitude and direction of acceleration remain constant.

(ii) There will be one dimensional motion if initial velocity and acceleration are parallel or anti-parallel to each other.

(iii) Equations of motion in scalar from

\[v = u + at\]
\[s = ut + \frac{1}{2}at^2\]
\[v^2 = u^2 + 2as\]
\[s = \left(\frac{u+v}{2}\right)t\]
\[s_n = u + \frac{a}{2}(2n-1)\]

Equation of motion in vector from

\[\vec{v} = \vec{u} + \vec{a}t\]
\[\vec{s} = \vec{u}t + \frac{1}{2}\vec{a}t^2\]
\[\vec{v} \cdot \vec{v} - \vec{u} \cdot \vec{u} = 2\vec{a} \cdot \vec{s}\]
\[\vec{s} = \frac{1}{2}(\vec{u} + \vec{v})t\]
\[\vec{s}_n = \vec{u} + \frac{\vec{a}}{2}(2n-1)\]
Important points for uniformly accelerated motion

(i) If a body starts from rest and moves with uniform acceleration then distance covered by the body in \( t \) sec is proportional to \( t^2 \) (i.e. \( s \propto t^2 \)).

So the ratio of distance covered in 1 sec, 2 sec and 3 sec is \( 1^2 : 2^2 : 3^2 \) or \( 1:4:9 \).

(ii) If a body starts from rest and moves with uniform acceleration then distance covered by the body in \( n \)th sec is proportional to \( (2n - 1) \) (i.e. \( s_n \propto (2n - 1) \)).

So the ratio of distance covered in I sec, II sec and III sec is \( 1 : 3 : 5 \).

(iii) A body moving with a velocity \( u \) is stopped by application of brakes after covering a distance \( s \). If the same body moves with velocity \( nu \) and same braking force is applied on it then it will come to rest after covering a distance of \( n^2s \).

2.10 Motion of Body Under Gravity (Free Fall).

Acceleration produced in the body by the force of gravity, is called acceleration due to gravity. It is represented by the symbol \( g \).

In the absence of air resistance, it is found that all bodies fall with the same acceleration near the surface of the earth. This motion of a body falling towards the earth from a small altitude \( (h \ll R) \) is called free fall.

An ideal one-dimensional motion under gravity in which air resistance and the small changes in acceleration with height are neglected.

PROJECTILE MOTION

2.11 Introduction.

If the force acting on a particle is oblique with initial velocity then the motion of particle is called projectile motion.

2.12 Projectile

A body which is in flight through the atmosphere but is not being propelled by any fuel is called projectile.
2.13 Assumptions of Projectile Motion.

(1) There is no resistance due to air.

(2) The effect due to curvature of earth is negligible.

(3) The effect due to rotation of earth is negligible.

(4) For all points of the trajectory, the acceleration due to gravity ‘g’ is constant in magnitude and direction.

2.14 Principles of Physical Independence of Motions.

(1) The motion of a projectile is a two-dimensional motion. So, it can be discussed in two parts. Horizontal motion and vertical motion. These two motions take place independent of each other. This is called the principle of physical independence of motions.

(2) The velocity of the particle can be resolved into two mutually perpendicular components. Horizontal component and vertical component.

(3) The horizontal component remains unchanged throughout the flight. The force of gravity continuously affects the vertical component.

(4) The horizontal motion is a uniform motion and the vertical motion is a uniformly accelerated retarded motion.

2.15 Types of Projectile Motion

(1) Oblique projectile motion (2) Horizontal projectile motion (3) Projectile motion on an inclined plane

2.16 Oblique Projectile.

In projectile motion, horizontal component of velocity \((u \cos \theta)\), acceleration \((g)\) and mechanical energy remains constant while, speed, velocity, vertical component of velocity \((u \sin \theta)\), momentum, kinetic energy and potential energy all changes. Velocity, and KE are maximum at the point of projection while minimum (but not zero) at highest point.
(1) **Equation of trajectory**: A projectile thrown with velocity \( u \) at an angle \( \theta \) with the horizontal. The velocity \( u \) can be resolved into two rectangular components \( u \cos \theta \) component along \( X \)-axis and \( u \sin \theta \) component along \( Y \)-axis.

\[
y = x \tan \theta - \frac{1}{2} \frac{gx^2}{u^2 \cos^2 \theta}
\]

**Note:**
- Equation of oblique projectile also can be written as

\[
y = x \tan \theta \left[ 1 - \frac{x}{R} \right]
\]

(where \( R \) = horizontal range)

(2) **Displacement of projectile (\( \vec{r} \))**: Let the particle acquires a position \( P \) having the coordinates \((x, y)\) just after time \( t \) from the instant of projection. The corresponding position vector of the particle at time \( t \) is \( \vec{r} \) shown in the figure.

\[
\vec{r} = x \hat{i} + y \hat{j} \quad ...(i)
\]

The horizontal distance covered during time \( t \) given as

\[
x = v_x t \Rightarrow x=u \cos \theta \ t \quad ....(ii)
\]

The vertical velocity of the particle at time \( t \) is given as

\[
y = u \sin \theta \ t - \frac{1}{2} gt^2 \quad ....(iii)
\]

and \( \phi = \tan^{-1}(y/x) \)
Note-

- The angle of elevation $\phi$ of the highest point of the projectile and the angle of projection $\theta$ are related to each other as
  \[ \tan \phi = \frac{1}{2} \tan \theta \]

(3) **Instantaneous velocity $v$**: In projectile motion, vertical component of velocity changes but horizontal component of velocity remains always constant.

Let $v_i$ be the instantaneous velocity of projectile at time $t$ direction of this velocity is along the tangent to the trajectory at point $P.$

\[
\vec{v}_i = v_x i + v_y j \Rightarrow v_i = \sqrt{v_x^2 + v_y^2}
\]

Direction of instantaneous velocity $\tan \alpha = \frac{v_y}{v_x} = \frac{u \sin \theta - gt}{u \cos \theta}$

(7) **Time of flight**: The total time taken by the projectile to go up and come down to the same level from which it was projected is called time of flight.

For vertical upward motion $0 = u \sin \theta - gt \Rightarrow t = \frac{u \sin \theta}{g}$

Time of flight $T = 2t = \frac{2u \sin \theta}{g}$

(8) **Horizontal range**: It is the horizontal distance travelled by a body during the time of flight. So by using second equation of motion

\[
R = u \cos \theta \times T = u \cos \theta \times (2u \sin \theta / g) = \frac{u^2 \sin 2\theta}{g}
\]

\[
R = \frac{u^2 \sin 2\theta}{g}
\]

If angle of projection is changed from $\theta$ to $\theta' = (90 - \theta)$ then range remains unchanged. These angles are called complementary angles of projection.
(iv) Maximum range : For range to be maximum \( \frac{dR}{d\theta} = 0 \Rightarrow d \left( \frac{u^2 \sin 2\theta}{g} \right) = 0 \)
a projectile will have maximum range when it is projected at an angle of 45° to the horizontal and the maximum range will be \((u^2/g)\).

When the range is maximum, the height \( H \) reached by the projectile

\[
H = \frac{u^2 \sin^2 \theta}{2g} = \frac{u^2 \sin^2 45}{2g} = \frac{u^2}{4g} = \frac{R_{max}}{4}
\]

(v) Relation between horizontal range and maximum height:

\( R = 4H \cot \theta \)

If \( R = 4H \cot \theta = \tan^{-1}(1) \) or \( \theta = 45° \).

(9) Maximum height : It is the maximum height from the point of projection, a projectile can reach.

So, by using \( v^2 = u^2 + 2as \)

\[
0 = (u \sin \theta)^2 - 2gH
\]

\[
H = \frac{u^2 \sin^2 \theta}{2g}
\]

(i) \( H_{max} = \frac{u^2}{2g} \) (when \( \sin^2 \theta = \max = 1 \ i.e., \ \theta = 90° \))

i.e., for maximum height body should be projected vertically upward.

(10) Motion of a projectile as observed from another projectile is a straight line.

2.17 Horizontal Projectile

A body be projected horizontally from a certain height ‘\( y \)’ vertically above the ground with initial velocity \( u \). If friction is considered to be absent, then there is no other horizontal force which can affect the horizontal motion. The horizontal velocity therefore remains constant.
(4) **Time of flight** : If a body is projected horizontally from a height $h$ with velocity $u$ and time taken by the body to reach the ground is $T$, then

$$T = \frac{2h}{g}$$

(5) **Horizontal range** : Let $R$ is the horizontal distance travelled by the body

$$R = u \sqrt{\frac{2h}{g}}$$

(6) If projectiles $A$ and $B$ are projected horizontally with different initial velocity from same height and third particle $C$ is dropped from same point then

(i) All three particles will take equal time to reach the ground.

(ii) Their net velocity would be different but all three particle possess same vertical component of velocity.

(iii) The trajectory of projectiles $A$ and $B$ will be straight line *w.r.t.* particle $C$.

(7) If various particles thrown with same initial velocity but indifferent direction then

(i) They strike the ground with same speed at different times irrespective of their initial direction of velocities.

(ii) Time would be least for particle which was thrown vertically downward.

(iii) Time would be maximum for particle $A$ which was thrown vertically upward.

---

**CIRCULAR MOTION**

Circular motion is another example of motion in two dimensions. To create circular motion in a body it must be given some initial velocity and a force must then act on the body which is always directed at right angles to instantaneous velocity.

Circular motion can be classified into two types - Uniform circular motion and non-uniform circular motion.
2.18 Variables of Circular Motion.

(1) **Displacement and distance** : When particle moves in a circular path describing an angle \( \theta \) during time \( t \) (as shown in the figure) from the position \( A \) to the position \( B \), we see that the magnitude of the position vector \( \vec{r} \) (that is equal to the radius of the circle) remains constant, i.e., \( |\vec{r}_1| = |\vec{r}_2| = r \) and the direction of the position vector changes from time to time.

(i) **Displacement** : The change of position vector or the displacement \( \Delta \vec{r} \) of the particle from position \( A \) to position \( B \) is given by referring the figure.

\[
\Delta \vec{r} = \vec{r}_2 - \vec{r}_1
\]

\[
\Delta r = 2r \sin \frac{\theta}{2}
\]

(ii) **Distance** : The distance covered by the particle during the time \( t \) is given as \( d = \) length of the arc \( AB \)

(2) **Angular displacement** (\( \theta \)) : The angle turned by a body moving on a circle from some reference line is called angular displacement.

(i) Dimension = \([M^0L^0T^0]\) (as \( \theta = \) arc/radius).

(ii) Units = Radian or Degree. It is sometimes also specified in terms of fraction or multiple of revolution.

(iii) \( 2\pi \) rad = 360° = 1 Revolution

(iv) Angular displacement is a axial vector quantity.
Its direction depends upon the sense of rotation of the object can be given by Right Hand Rule; which states that if the curvature of the fingers of right hand represents the sense of rotation of the object, then the thumb, held perpendicular to the curvature of the fingers, represents the direction of angular displacement vector.

(v) Relation between linear displacement and angular displacement  
\[ s = \theta r \] or  
\[ s = r \theta \]

(3) **Angular velocity (ω):** Angular velocity of an object in circular motion is defined as the time rate of change of its angular displacement.

(i) Angular velocity  
\[ \omega = \frac{\text{angle traced}}{\text{time taken}} = \frac{Lt}{\Delta t} = \frac{\Delta \theta}{\Delta t} = \frac{d\theta}{dt} \]

(ii) Dimension: \([M^0L^0T^{-1}]\]

(iii) Units: Radians per second \((rad.s^{-1})\) or Degree per second.

(iv) Angular velocity is an axial vector. Its direction is the same as that of \(\Delta \theta\).

(v) Relation between angular velocity and linear velocity  
\[ \vec{v} = \omega \times \vec{r} \]

(vi) For uniform circular motion \(co\) remains constant whereas for non-uniform motion \(\omega\) varies with respect to time.

(4) **Change in velocity:** We want to know the magnitude and direction of the change in velocity of the particle which is performing uniform circular motion as it moves from \(A\) to \(B\) during time \(t\) as shown in figure. The change in velocity vector is given as  
\[ \Delta \vec{v} = \vec{v}_2 - \vec{v}_1 \]

\[ \Delta v = 2v \sin \frac{\theta}{2} \]
• Relation between linear velocity and angular velocity.

In vector form \( \vec{v} = \vec{\omega} \times \vec{r} \)

(5) \textit{Time period (T)} : In circular motion, the time period is defined as the time taken by the object to complete one revolution on its circular path.

(6) \textit{Frequency (n)} : In circular motion, the frequency is defined as the number of revolutions completed by the object on its circular path in a unit time.

(i) Units: \( s^{-1} \) or hertz (Hz).

(ii) Dimension: \([M^0L^0T^{-1}]\)

\textit{Note-}

• Relation between time period and frequency:
  \[ : T = \frac{1}{n} \]

• Relation between angular velocity, frequency and time period:
  \[ \omega = \frac{2\pi}{T} = 2\pi n \]

(7) \textit{Angular acceleration (a)} : Angular acceleration of an object in circular motion is defined as the time rate of change of its angular velocity.

(i) \[ \alpha = \Delta t \rightarrow \frac{\Delta \omega}{\Delta t} = \frac{d\omega}{dt} = \frac{d^2\theta}{dt^2} \]

(ii) Units: \( ra \ d \ s^{-2} \)

(iii) Dimension: \([M^0L^0T^{-2}]\)

(iv) Relation between linear acceleration and angular acceleration
  \[ \vec{a} = \vec{\alpha} \times \vec{r} \]

(v) For uniform circular motion since \( \theta \) is constant so \[ \alpha = \frac{d\omega}{dt} = 0 \]

(vi) For non-uniform circular motion \( \alpha \neq 0 \)
2.19 Centripetal Acceleration

(1) Acceleration acting on the object undergoing uniform circular motion is called centripetal acceleration.

(2) It always acts on the object along the radius towards the centre of the circular path.

(3) Magnitude of centripetal acceleration \( a = \frac{v^2}{r} = \omega^2 r = 4\pi^2 \frac{r}{T^2} \)

(4) Direction of centripetal acceleration: It is always the same as that of \( \Delta \overrightarrow{v} \).

2.20 Centripetal Force.

According to Newton's first law of motion, whenever a body moves in a straight line with uniform velocity, no force is required to maintain this velocity. But when a body moves along a circular path with uniform speed, its direction changes continuously i.e. velocity keeps on changing on account of a change in direction. According to Newton's second law of motion, a change in the direction of motion of the body can take place only if some external force acts on the body.

Due to inertia, at every point of the circular path; the body tends to move along the tangent to the circular path at that point (in figure). Since every body has directional inertia, a velocity cannot change by itself and as such we have to apply a force. But this force should be such that it changes the direction of velocity and not its magnitude. This is possible only if the force acts perpendicular to the direction of velocity. Because the velocity is along the tangent, this force must be along the radius (because the radius of a circle at any point is perpendicular to the tangent at that point).

Further, as this force is to move the body in a circular path, it must acts towards the centre. This centre-seeking force is called the centripetal force.

Hence, centripetal force is that force which is required to move a body in a circular path with uniform speed. The force acts on the body along the radius and towards centre.
(1) Formulae for centripetal force: \( F = \frac{mv^2}{r} = m\omega^2r = m \cdot 4\pi^2n^2r = \frac{m4\pi^2r}{T^2} \)

(2) Centripetal force in different situation

<table>
<thead>
<tr>
<th>Situation</th>
<th>Centripetal Force</th>
</tr>
</thead>
<tbody>
<tr>
<td>A particle tied to a string and whirled in a horizontal circle.</td>
<td>Tension in the string.</td>
</tr>
<tr>
<td>Vehicle taking a turn on a level road.</td>
<td>Frictional force exerted by the road on the tyres.</td>
</tr>
<tr>
<td>A vehicle on a speed breaker.</td>
<td>Weight of the body or a component of weight.</td>
</tr>
<tr>
<td>Revolution of earth around the sun.</td>
<td>Gravitational force exerted by the sun.</td>
</tr>
<tr>
<td>Electron revolving around the nucleus in an atom.</td>
<td>Coulomb attraction exerted by the protons in the nucleus.</td>
</tr>
<tr>
<td>A charged particle describing a circular path in a magnetic field.</td>
<td>Magnetic force exerted by the agent that sets up the magnetic field.</td>
</tr>
</tbody>
</table>

2.21 Centrifugal Force

It is an imaginary force due to incorporated effects of inertia. Centrifugal force is a fictitious force which has significance only in a rotating frame of reference.

2.22 Work done by Centripetal Force

The work done by centripetal force is always zero as it is perpendicular to velocity and hence instantaneous displacement.

Example:

(i) When an electron revolve around the nucleus in hydrogen atom in a particular orbit, it neither absorb nor emit any energy means its energy remains constant.

(ii) When a satellite established once in a orbit around the earth and it starts revolving with particular speed, then no fuel is required for its circular motion.

2.23 Skidding of Vehicle on a Level Road.

When a vehicle turns on a circular path it requires centripetal force.
If friction provides this centripetal force then vehicle can move in circular path safely if Friction force ≥ Required centripetal force

\[
\mu mg \geq \frac{mv^2}{r}
\]

\[
\therefore \quad v_{safe} \leq \sqrt{\mu g}
\]

This is the maximum speed by which vehicle can turn in a circular path of radius \(r\), where coefficient of friction between the road and tyre is \(\mu\).

### 2.24 Skidding of Object on a Rotating Platform.

On a rotating platform, to avoid the skidding of an object (mass \(m\)) placed at a distance \(r\) from axis of rotation, the centripetal force should be provided by force of friction. Centripetal force = Force of friction

\[
\omega^2 r = \mu mg
\]

\[
\therefore \quad \omega_{max} = \sqrt{\mu g/r},
\]

Hence maximum angular velocity of rotation of the platform is \(\sqrt{\mu g/r}\), so that object will not skid on it.

### 2.25 Bending of a Cyclist

A cyclist provides himself the necessary centripetal force by leaning inward on a horizontal track, while going round a curve. Consider a cyclist of weight \(mg\) taking a turn of radius \(r\) with velocity \(v\). In order to provide the necessary centripetal force, the cyclist leans through angle \(\theta\) inwards as shown in figure.

\[
R \sin \theta = \frac{mv^2}{r} \quad \ldots \ldots \text{(i)}
\]

and \(R \cos \theta = mg\) \ldots \ldots \text{(ii)}
Dividing equation (i) by (ii), we have

\[ \tan \theta = \frac{v^2}{rg} \]  
...............(iii)

**Note:**
- For the same reasons, an ice skater or an aeroplane has to bend inwards, while taking a turn.

### 2.26 Banking of a Road.

For getting a centripetal force cyclist bend towards the centre of circular path but it is not possible in case of four wheelers.

Therefore, outer bed of the road is raised so that a vehicle moving on it gets automatically inclined towards the centre.

- [Fig. (A)]
- [Fig. (B)]

\[ \tan \theta = \frac{v^2}{rg} \]  
......(iii)

If \( l = \) width of the road, \( h = \) height of the outer edge from the ground level then from the

\[ \text{or } \tan \theta = \frac{\omega^2 r}{g} = \frac{v \omega}{rg} \]  
......(iv) [As \( v=r\omega)\]
If \( l = \) width of the road, \( h = \) height of the outer edge from the ground level then from the figure (B)

\[
\tan \theta = \frac{h}{x} = \frac{h}{l} \quad \text{\ldots\ldots (v)} \quad [\text{since } \theta \text{ is very small}]
\]

- Maximum safe speed on a banked frictional road \( v = \sqrt{\frac{rg(\mu + \tan \theta)}{1 - \mu \tan \theta}} \)

**KINEMATICS**

**1 MARK QUESTIONS**

Q1. Under what condition is the average velocity equal the instantaneous velocity?

Q2. Draw Position time graph of two objects, A & B moving along a straight line, when their relative velocity is zero.

Q3. Suggest a situation in which an object is accelerated and have constant speed.

Q4. Two balls of different masses are thrown vertically upward with same initial velocity. Maximum heights attained by them are \( h_1 \) and \( h_2 \) respectively what is \( h_1/h_2 \) ?

Q5. A car moving with velocity of 50 kmh\(^{-1}\) on a straight road is ahead of a jeep moving with velocity 75 kmh\(^{-1}\). How would the relative velocity be altered if jeep is ahead of car?

Q6. Which of the two-linear velocity or the linear acceleration gives the direction of motion of a body?

Q7. Will the displacement of a particle change on changing the position of origin of the coordinate system?

Q8. If the instantaneous velocity of a particle is zero, will its instantaneous acceleration be necessarily zero.? 

Q9. A Projectile is fired with Kinetic energy 1 KJ. If the range is maximum, what is its Kinetic energy, at the highest point?
Q10. Write an example of zero vector.

Q11. State the essential condition for the addition of vectors.

Q12. When is the magnitude of $\vec{A} + \vec{B}$ equal to the magnitude of $\vec{A} - \vec{B}$?

Q13. What is the maximum number of component into which a vector can be resolved?

Q14. A body projected horizontally moves with the same horizontal velocity although it moves under gravity. Why?

Q15. What is the angle between velocity and acceleration at the highest point of a projectile motion?

Q16. When does (i) height attained by a projectile maximum? (ii) horizontal range is maximum?

Q17. What is the angle between velocity vector and acceleration vector in uniform circular motion?

Q18. A particle is in clockwise uniform circular motion the direction of its acceleration is radially inward. If sense of rotation or particle is anticlockwise then what is the direction of its acceleration?

Q19. A train is moving on a straight track with acceleration $a$. A passenger drops a stone. What is the acceleration of stone with respect to passenger?

Q20. What is the average value of acceleration vector in uniform circular motion over one cycle?

Q21. Does a vector quantity depends upon frame of reference chosen?

Q22. What is the angular velocity of the hour hand of a clock?

Q23. What is the source of centripetal acceleration for earth to go round the sun?

Q24. What is the unit vector perpendicular to the plane of vectors $\vec{A}$ and $\vec{B}$?

Q25. What is the angle between $(\vec{A} + \vec{B})$ and $(\vec{A} \times \vec{B})$?
2 MARKS

Q26. What are positive and negative acceleration in straight line motion?

Q27. Can a body have zero velocity and still be accelerating? If yes give any situation.

Q28. The displacement of a body is proportional to \( t^3 \), where \( t \) is time elapsed. What is the nature of acceleration - time graph of the body?

Q29. Suggest a suitable physical situation for the following graph.

\[
\begin{array}{c}
\text{Velocity (v)} \\
\end{array}
\]

\[
\begin{array}{c}
time \\
\end{array}
\]

Q30. An object is in uniform motion along a straight line, what will be position time graph for the motion of the object if

(i) \( x_0 \) = positive, \( v \) = negative \( |v| \) is constant

(ii) both \( x_0 \) and \( v \) are negative \( |v| \) is constant

where \( x_0 \) is position at \( t = 0 \)

Q31. A cyclist starts from centro O of a Circular Park of radius 1 km and moves along the path OPRQO as shown. If he maintains constant speed of 10 ms\(^{-1}\), what is his acceleration at point R in magnitude and direction?

Q32. What will be the effect on horizontal range of a projectile when its initial velocity is doubled keeping angle of projection same?

Q33. The greatest height to which a man can throw a stone is \( h \). What will be the greatest distance up to which he can throw the stone?

Q34. A person sitting in a train moving at constant velocity throws a ball vertically upwards. How will the ball appear to move to an observer.
(i) Sitting inside the train
(ii) Standing outside the train

Q35. A gunman always keep his gun slightly tilted above the line of sight while shooting. Why?

Q36. Is the acceleration of a particle in circular motion not always towards the centre. Explain.

3 MARKS

Q37. Draw (a) acceleration - time (b) velocity - time (c) Position - time graphs representing motion of an object under free fall. Neglect air resistance.

Q38. The velocity time graph for a particle is shown in figure. Draw acceleration time graph from it.

![Graph](image)

Q39. For an object projected upward with a velocity \( V_o \) which comes back to the same point after some time, draw

(i) Acceleration-time graph (ii) Position-time graph
(iii) velocity time graph.

Q40. The acceleration of a particle in ms\(^{-2}\) is given by \( a = 3t^2 + 2t + 2 \), Where time \( t \) is in second.

If the particle starts with a velocity \( v = 2\text{ms}^{-1} \) at \( t = 0 \), then find the velocity at the end of 2s.

Q41. Two vectors \( \vec{A} \) & \( \vec{B} \) are inclined to each other at an angle \( \theta \). Using Parallelogram law of vectors addition, find the magnitude and direction of their resultant.
Q42. Establish the following vector inequalities:

(i) \[ \left| \mathbf{a} + \mathbf{b} \right| \leq \left| \mathbf{a} \right| + \left| \mathbf{b} \right| \]

(ii) \[ \left| \mathbf{a} + \mathbf{b} \right| \geq \left| \mathbf{a} \right| - \left| \mathbf{b} \right| \]

Q43. A body is projected at an angle \( \theta \) with the horizontal. Derive an expression for its horizontal range. Show that there are two angles \( \theta_1 \) and \( \theta_2 \) projections for the same horizontal range, such that \( \theta_1 + \theta_2 = 90^\circ \).

Q44. Prove that the maximum horizontal range is four times the maximum height attained by the projectile, when fired at an inclination so as to have maximum range.

Q45. Show that there are two values of time for which a projectile is at the same height. Also show that the sum of these two times is equal to the time of flight.

Q46. A car moving along a straight highway with speed of 125 km h\(^{-1}\) is brought to a stop within a distance of 200 m. What is the retardation of the car (assumed uniform) and how long does it take for the car to stop?

Q47. Derive the following equations of motion for an object moving with constant acceleration along a straight line using graphical method.

(i) \( v = u + at \)

(ii) \( S = ut + \frac{1}{2}at^2 \)

(iii) \( v^2 = u^2 + 2as \)

Where symbols have usual meanings.

Q48. A projectile is fired horizontally with a velocity \( u \). Show that its trajectory is a parabola. Also obtain expression for

(i) time of flight
(ii) horizontal range
(iii) velocity at any instant.

Q49. Define centripetal acceleration. Derive an expression for the centripetal acceleration of a particle moving with constant speed v along a circular path of radius r.

**NUMERICALS**

Q50. The V–t graphs of two objects make angle 30° and 60° with the time axis. Find the ratio of their accelerations.

Q51. When the angle between two vectors of equal magnitudes is $\frac{2\pi}{3}$, prove that the magnitude of the resultant is equal to either.

Q52. If $\vec{A} = 3\hat{i} + 4\hat{j}$ and $\vec{B} = 7\hat{i} + 24\hat{j}$, find a vector having the same magnitude as $\vec{B}$ and parallel to $\vec{A}$.

Q53. (a) If $\hat{i}$ and $\hat{j}$ are unit vectors along x & y axis respectively then what is magnitude and direction of $(\hat{i} + \hat{j})$ and $(\hat{i} - \hat{j})$?

(b) Find the components of vector $\vec{a} = 2\hat{i} + 3\hat{j}$ along the directors of vectors $(\hat{i} + \hat{j})$ and $(\hat{i} - \hat{j})$.

Q54. What is the vector sum of n coplanar forces, each of magnitude F, if each force makes an angle of $\frac{2\pi}{n}$ with the preceding force?

Q55. A car is moving along x-axis. As shown in figure it moves from 0 to P in 18 seconds and return from P to Q in 6 second. What are the average velocity and average speed of the car in going from

(i) O to P

(ii) from O to P and back to Q.

---

[Class XI : Physics] 60
Q56. On a 60 km straight road, a bus travels the first 30 km with a uniform speed of 30 kmh⁻¹. How fast must the bus travel the next 30 km so as to have average speed of 40 kmh⁻¹ for the entire trip?

Q57. The displacement x of a particle varies with time as \( x = 4t^2 - 15t + 25 \). Find the position, velocity and acceleration of the particle at \( t = 0 \).

Q58. A driver takes 0.20 second to apply the breaks (reaction time). If he is driving car at a speed of 54 kmh⁻¹ and the breaks cause a deceleration of 6.0 ms⁻². Find the distance travelled by car after he sees the need to put the breaks.

Q59. From the top of a tower 100m in height a ball is dropped and at the same time another ball is projected vertically upwards from the ground with a velocity of 25 m/s. Find when and where the two balls will meet? (\( g = 9.8 \) m/s)

Q60. A ball thrown vertically upwards with a speed of 19.6 m/s⁻¹ from the top of a tower returns to the earth in 6s. Find the height of the tower (\( g = 9.8 \) m/s²)

Q61. Two towns A and B are connected by a regular bus service with a bus leaving in either direction every T min. A man cycling with a speed of 20kmh⁻¹ in the direction A to B notices that a bus goes past him every 18 min in the direction of his motion, and every 6 min in the opposite direction.

What is the period T of the bus service and with what speed do the buses ply of the road?

Q62. A motorboat is racing towards north at 25 kmh⁻¹ and the water current in that region is 10 kmh⁻¹ in the direction of 60° east of south. Find the resultant velocity of the boat.

Q63. An aircraft is flying at a height of 3400 m above the ground. If the angle subtended at a ground observation point by the aircraft position 10 second apart is 30°, what is the speed of the aircraft?

Q64. A boat is moving with a velocity \((3\hat{i} - 4\hat{j})\) with respect to ground. The water in river is flowing with a velocity \((-3\hat{i} - 4\hat{j})\) with respect to ground. What is the relative velocity of boat with respect to river?
Q65. A hiker stands on the edge of a cliff 490 m above the ground and throws a stone horizontally with an initial speed of 15 ms\(^{-1}\). Neglecting air resistance, find the time taken by the stone to reach the ground and the speed with which it hits the ground (g = 9.8 ms\(^{-2}\))

Q66. A bullet fired at an angle of 30° with the horizontal hits the ground 3 km away. By adjusting the angle of projection, can one hope to hit the target 5 km away? Assume that the muzzle speed to be fixed and neglect air resistance.

Q67. A stone tied to the end of a string 80 cm long is whirled in a horizontal circle with a constant speed. If the stone makes 14 revolutions in 25 seconds, what is the magnitude and direction of acceleration of the stone?

Q68. A cyclist is riding with a speed of 27 kmh\(^{-1}\). As he approaches a circular turn on the road of radius 30 m, he applies brakes and reduces his speed at the constant rate 0.5 ms\(^{-2}\). What is the magnitude and direction of the net acceleration of the cyclist on the circular turn?

Q69. If the magnitude of two vectors are 3 and 4 and their scalar product is 6, find angle between them.

Q70. Find the value of \(\lambda\) so that the vector \(\vec{\mathbf{A}} = 2\mathbf{i} + \lambda\mathbf{j} + \mathbf{k}\) and \(\vec{\mathbf{B}} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}\) are perpendicular to each other.

Q71. The speed–time graph of a particle along a fixed direction is as shown in fig. obtain the distance travelled by a particle between (a) \(t = 0\) to 10s (b) \(t = 2\) to 65.

What is the average speed of the particle over the intervals in (a) and (b)?
SOLUTIONS

[I MARKS SOLUTIONS]

Ans 1. When the body is moving with uniform velocity.

Ans 2.

Ans 3. Uniform Circular Motion

Ans 4. Same height \( \therefore \frac{h_1}{h_2} = 1 \)

Ans 5. No change

Ans 6. Linear velocity

Ans 7. Will not change.

Ans 8. No, (highest point of vertical upward motion under gravity)

Ans 9. Here \( \frac{1}{2}mv^2 = 1 \text{ KJ} = 1000 \text{J}, \theta = 45^0 \)

At the highest Point, K.E. \( \frac{1}{2}m(v \cos \theta)^2 = \frac{1}{2} \frac{mv^2}{2} = \frac{1000}{2} = 500 \text{J} \)

Ans10. The velocity vectors of a stationary object is a zero vectors.

Ans11. They must represent the physical quantities of same nature.

Ans12. When \( \vec{A} \) is perpendicular to \( \vec{B} \).

Ans13. Infinite.

Ans14. Because horizontal component of gravity is zero along horizontal direction.

Ans15. 90°
Ans16. height is maximum at $\theta = 90$

Range is maximum at $\theta = 45$.

Ans17. $90^\circ$

Ans18. Radial inward.

Ans19. $\sqrt{a^2 + g^2}$ where $g =$ Acceleration due to gravity.

Ans21. No.

Ans22. $W = \frac{2\pi}{12} = \frac{\pi}{6}$ rad h$^{-1}$

Ans24. $\hat{n} = \frac{\vec{A} \times \vec{B}}{|\vec{A} \times \vec{B}|}$

Ans25. $90^\circ$

**ANSWERS [2 MARKS]**

Ans26. If speed of an object increases with time, its acceleration is positive. (Acceleration is in the direction of motion) and if speed of an object decreases with time its acceleration is negative (Acceleration is opposite to the direction of motion).

Ans27. Yes, at the highest point of vertical upward motion under gravity.

Ans28. as $s \propto t^3 \Rightarrow s = kt^3$

velocity $V = \frac{ds}{dt} = 3kt^2$

acceleration $a = \frac{dv}{dt} = 6kt$
i.e $a \propto t$

$\Rightarrow$ motion is uniform, accelerated motion. $a - t$ graph is straight-line.

Ans29. A ball thrown up with some initial velocity rebounding from the floor with reduced speed after each hit.

Ans30. (i) $x = x_0 t$

(ii) $x = x_0 - v_0 t$

Ans31. Centripetal acceleration $a_c = \frac{v^2}{r} = \frac{10^2}{1000} = 0.1 \text{ m/s}^2$ along RO.

Ans32. $R = \frac{u^2 \sin 2\theta}{g} \Rightarrow R \propto u^2$

Range becomes four times.

Ans33. Maximum height $H = \frac{u^2 \sin^2 \theta}{2g}$

$\Rightarrow H_{max} = \frac{u^2}{2g} = h(\text{at } \theta = 90^\circ)$

Max, Range $R_{max} = \frac{u^2}{g} = 2h$

Ans34. (i) Vertical straight line motion

(ii) Parabolic path.

Ans35. Because bullet follow Parabolic trajectory under constant downward acceleration.

Ans36. No acceleration is towards the centre only in case of uniform circular motion.
Ans37. The object falls with uniform acceleration equal to 'g'.

Ans38.

Ans39. $2t_0 \rightarrow$ total time of the Journey

$x_0 \rightarrow$ highest position.

Ans40. $a = \frac{dv}{dt} = 3t^2 + 2t + 2) \, dt$

$dv = (3t^2 + 2t + 2) \, dt$
\[
\int dv = \int (3t^2 + 2t + 2) dt
\]

\[
v = t^3 + t^2 + 2t + c
\]

\(c = 2\text{m/s} \quad v = 18\text{m/s at } t = 2s.\)

Ans 46. Initial velocity of car.

\[
u = 126 \text{ kmh}^{-1} = 126 \times \frac{5}{8} \text{ ms}^{-1} = 35 \text{ ms}^{-1} \quad \ldots(\text{i})
\]

Since, the car finally comes to rest, \(v = 0\)

Distance covered, \(s = 200 \text{ m}, \ a = ?, \ t = ?\)

\[v^2 = u^2 - 2as\]

or, \(a = \frac{v^2 - u^2}{2s}\) \ldots(\text{ii})

Substituting the values from eq. (i) in eq (ii), we get

\[
a = \frac{0 - (35)^2}{2 \times 200} = \frac{-35 \times 35}{400}
\]

\[= -\frac{49}{16} \text{ ms}^{-2}\]

\[= -3.06 \text{ ms}^{-2}\]

Negative sign shows that acceleration in negative which is called retardation, i.e., car is uniformly retarded at \(-a = 3.06 \text{ ms}^{-2}\).

To find \(t\), let us use the relation

\[v = u + at\]

\[
\Rightarrow t = \frac{v - u}{a}
\]

Use \(a = -3.06 \text{ ms}^{-2}, \ v = 0, \ u = 35 \text{ ms}^{-1}.\)

\[
\therefore t = \frac{0 - 35}{-3.06} = 11.44 \text{s}
\]

\[
\therefore t = 11.44 \text{s sec.}
\]
ANSWER

A50 \( \frac{a_1}{a_2} = \frac{\tan 30}{\tan 60} = \frac{1/\sqrt{3}}{\sqrt{3}} = \frac{1}{3} \Rightarrow 1:3 \)

A51 \[ R = (P^2 + Q^2 + 2PQ \cos \theta)^{1/2} \]
\[ = \left( P^2 + P^2 + 2P \cdot P \cos \frac{2\pi}{3} \right)^{1/2} \]
\[ = \left[ 2P^2 + 2P^2 \left( -\frac{1}{2} \right) \right]^{1/2} = P \]

A52 \[ |\vec{A}| = \sqrt{3^2 + 4^2} = 5 \]
also \[ |\vec{B}| = \sqrt{7^2 + 2^2} = 25 \]
desired vector \[ |\vec{B}| \vec{\hat{A}} = 25 \frac{3\hat{i} + 4\hat{j}}{5} \]
\[ = 5(3\hat{i} + 4\hat{j}) = 15\hat{i} + 20\hat{j} \]

A54 Resultant force is zero.

A55 (i) O to P Average velocity \( = 20 \text{ ms}^{-1} \)
average speed \( = 20 \text{ ms}^{-1} \)
(ii) O to P and back to Q
Average velocity \( = 10 \text{ ms}^{-1} \)
Average speed \( = 20 \text{ ms}^{-1} \)

A56 \[ V_{avg} = \frac{S_1 + S_2}{t_1 + t_2} = \frac{StS}{S \left( \frac{1}{V_1} + \frac{1}{V_2} \right)} = \frac{2V_1V_2}{V_1 + V_2} \]
or \[ 40 = \frac{2 \times 30 \times V_2}{V_1 + V_2} \Rightarrow V_2 = 60 \text{ kmh}^{-1} \]
A57  position $x = 25 \text{ m}$

velocity $V = \frac{dx}{dt} / t = -15 \text{ ms}^{-1}$

acceleration $a = \frac{dv}{dt} = 8 \text{ ms}^{-2}$

A58  (distance covered during $0.20 \text{ s}$) +

(distance covered until rest)

$= (15 \times 0.20) + [18.75] = 21.75 \text{ m}$

A59  For the ball chapped from the top

$x = 4.9t^2$

For the ball thrown upwards

$100 - x = 2t - 4.9t^2$

Science (i) & (ii)

t = 45 & x = 78.4 \text{ m}$

A60  using $s = ut + \frac{1}{2}at^2$

$h = 58.8 \text{ m}$

A61  $V = 40 \text{ kmh}^{-1}$ and $T = 9 \text{ min}$

A62  $V = 21.8 \text{ kmh}^{-1}$

angle with north $\theta = 23.4$

A63  Speed = $182.2 \text{ ms}^{-1}$

A64  $\vec{V}_{bw} = \vec{V}_b - \vec{V}_w$

$= 6i + 8j$
A65 \[ \text{time} = 10 \text{ seconds} \]

\[ V = \sqrt{V_x^2 + V_y^2} = \sqrt{15^2 + 98^2} = 99.1 \text{ms}^{-1} \]

A66 Maximum Range = 3.46 km

So it is not possible.

A67 \[ W = \frac{88 \text{ rods}}{25} W = \frac{2\pi}{T} = \frac{2\pi N}{t} \]

\[ a = 991.2 \text{ cms}^{-2} \]

A68 \[ a_c = \frac{V^2}{r} = 0.7 \text{ ms}^{-2} \]

\[ a_r = 0.5 \text{ms}^{-2} \]

\[ a = \sqrt{a_c^2 + a_r^2} = 0.86 \text{ms}^{-2} \]

If \( \theta \) is the angle between the net acceleration and the velocity of the cyclist, then

\[ \theta = \tan^{-1} \left( \frac{a_c}{a_r} \right) = \tan^{-1}(1.4) = 54^\circ 28' \]

A69 \[ \vec{A}.\vec{B} = AB \cos \theta \]

or \( 6 = (3 \times 4) \cos \theta \)

or \( \theta = 60^\circ \)

A70 \[ \because \vec{A} \perp \vec{B} \Rightarrow \vec{A}.\vec{B} = 0 \]

\[ \Rightarrow \lambda = 3 \]

A71 = Refer NCERT
UNIT 3

NEWTON’S LAWS OF MOTION

3.1 Inertia

(1) Inherent property of all the bodies by virtue of which they cannot change their state of rest or uniform motion along a straight line by their own is called inertia.

(2) Two bodies of equal mass possess same inertia because it is a factor of mass only.

3.2 Linear Momentum.

(1) Linear momentum of a body is the quantity of motion contained in the body.

(2) It is measured as the product of the mass of the body and its velocity i.e., Momentum = mass × velocity.

If a body of mass $m$ is moving with velocity $\vec{v}$ then its linear momentum $\vec{p}$ is given by $\vec{p} = m \vec{v}$

(3) It is a vector quantity and its direction is the same as the direction of velocity of the body.

(4) Units: $kg\text{–}m/\text{sec}$ [S.I.], $g\text{–}cm/\text{sec}$ [C.G.S.]

(5) Dimension: $[MLT^{-1}]$

3.3 Newton’s First Law

A body continue to be in its state of rest or of uniform motion along a straight line, unless it is acted upon by some external force to change the state.
(1) If no net force acts on a body, then the velocity of the body cannot change i.e. the body cannot accelerate.

(2) Newton’s first law defines inertia and is rightly called the law of inertia. Inertia are of three types:
   Inertia of rest, Inertia of motion, Inertia of direction

3.4 Newton’s Second Law.

(1) The rate of change of linear momentum of a body is directly proportional to the external force applied on the body and this change takes place always in the direction of the applied force.

(2) If a body of mass $m$, moves with velocity $\mathbf{v}$ then its linear momentum can be given by $\mathbf{p} = m \mathbf{v}$ and if force $\mathbf{F}$ is applied on a body, then

   $$\mathbf{F} = \frac{d\mathbf{p}}{dt} \quad (K= 1 \text{ in C.G.S. and S.I. units})$$

   $$\mathbf{F} = m \mathbf{a} \quad \text{(Force = mass } \times \text{ acceleration)}$$

3.5 Force

(1) Force is an external effect in the form of a push or pulls which:
   (i) Produces or tries to produce motion in a body at rest.
   (ii) Stops or tries to stop a moving body.
   (iii) Changes or tries to change the direction of motion of the body.

(2) Dimension: Force = mass $\times$ acceleration

   $$[\mathbf{F}] = [M][LT^{-2}] = [MLT^{-2}]$$

(3) Units: Absolute units: (i) Newton (S.I.) (ii) Dyne (C.G.S)

   Gravitational units: (i) Kilogram-force (M.K.S.) (ii) Gram-force (C.G.S)

(4) $\mathbf{F} = m \mathbf{a}$ formula is valid only if force is changing the state of rest or motion and the mass of the body is constant and finite.
(5) If $m$ is not constant \[ \vec{F} = \frac{d}{dt}(mv) = m\frac{d\vec{v}}{dt} + \vec{v}\cdot\frac{dm}{dt} \]

(6) No force is required to move a body uniformly along a straight line.

\[ \vec{F} = ma \Rightarrow \vec{F} = 0 \text{ (as } \vec{a} = 0) \]

(7) When force is written without direction then positive force means repulsive while negative force means attractive.

(8) Out of so many natural forces nuclear force is strongest while gravitational force weakest.

(9) **Central force** : If a position dependent force is always directed towards or away from a fixed point it is said to be central otherwise non-central.

(10) **Conservative or non conservative force** : If under the action of a force the work done in a round trip is zero or the work is path independent, the force is said to be conservative otherwise non conservative.

Example: Conservative force: Gravitational force, electric force, elastic force.

Non conservative force: Frictional force, viscous force.

(11) **Common forces in mechanics:**

(i) **Weight** : Weight of an object is the force with which earth attracts it. ($W = mg$)

(ii) **Reaction or Normal force** : When a body is placed on a rigid surface, the body experiences a force which is perpendicular to the surfaces in contact. Then force is called 'Normal force' or 'Reaction'.

(iii) **Tension** : The force exerted by the end of taut string, rope or chain against pulling (applied) force is called the tension. The direction of tension is so as to pull the body.

(iv) **Spring force** : Every spring resists any attempt to change its length. This resistive force increases with change in length. Spring force is given by $F = -Kx$ ; where $x$ is the change in length and $K$ is the spring constant (unit N/m).
3.6 Equilibrium of Concurrent Force.

(1) If all the forces working on a body are acting on the same point, then they are said to be concurrent.

(2) A body, under the action of concurrent forces, is said to be in equilibrium, when there is no change in the state of rest or of uniform motion along a straight line.

(3) The condition for the equilibrium of a body is that the vector sum of all the forces acting on the body must be zero.

3.7 Newton’s Third Law.

To every action, there is always an equal (in magnitude) and opposite (in direction) reaction.

If \( \vec{F}_{AB} \) = force exerted on body A by body B (Action) and \( \vec{F}_{BA} \) = force exerted on body B by body A (Reaction).

Then according to Newton’s third law of motion \( \vec{F}_{AB} = -\vec{F}_{BA} \)

Example:

(i) A book lying on a table exerts a force on the table which is equal to the weight of the book. This is the force of action.

(ii) Swimming is possible due to third law of motion.

(iii) When a gun is fired, the bullet moves forward (action). The gun recoils backward (reaction)

3.8 Frame of Reference.

(1) A frame in which an observer is situated and makes his observations is known as his ‘Frame of reference’.

It is associated with a co-ordinate system.

(2) Frame of reference are of two types: (i) Inertial frame of reference (ii) Non-inertial frame of reference.

(i) Inertial frame of reference :
(a) A frame of reference which is at rest or which is moving with a uniform velocity along a straight line is called an inertial frame of reference.

(b) In inertial frame of reference Newton's laws of motion holds good.

(c) Ideally no inertial frame exist in universe. For practical purpose a frame of reference may be considered as inertial if its acceleration is negligible with respect to the acceleration of the object to be observed.

*Example*: The lift at rest, lift moving (up or down) with constant velocity,

(ii) *Non inertial frame of reference*:

(a) Accelerated frame of references are called non-inertial frame of reference.

(b) Newton's laws of motion are not applicable in non-inertial frame of reference.

*Example*: Car moving in uniform circular motion, lift which is moving upward or downward with some acceleration, plane which is taking off.

### 3.9 Impulse

(1) When a large force works on a body for very small time interval, it is called impulsive force.

An impulsive force does not remain constant, but changes first from zero to maximum and then from maximum to zero. In such case we measure the total effect of force.

(2) Impulse of a force is a measure of total effect of force.

(3) \( \bar{I} = \int_{t_1}^{t_2} \vec{F} \, dt \).

(4) Impulse is a vector quantity and its direction is same as that of force.

(5) Dimension: \([MLT^{-1}]\)
(6) Units: Newton second or Kg–ms\(^{-1}\) (S.I.) and Dyne second or gm cm sr\(^{-1}\) (C.G.S.)

(7) Force-time graph- Impulse is equal to the area under \(F–t\) curve.

\[
I = \text{Area between curve and time axis} = \frac{1}{2} F t
\]

(8) If \(F_{av}\) is the average magnitude of the force then

\[
I = \int_{t_1}^{t_2} F \, dt = F_{av} \int_{t_1}^{t_2} dt = F_{av} \Delta t
\]

(9) From Newton’s second law \(\vec{F} = \dfrac{d\vec{p}}{dt}\)

\[
\text{or } \int_{t_1}^{t_2} \vec{F} \, dt = \int_{p_1}^{p_2} d\vec{p} \Rightarrow \vec{i} = \vec{p}_2 - \vec{p}_1 = \Delta \vec{p}
\]

\(i.e.\) The impulse of a force is equal to the change in momentum. This statement is known as Impulse momentum theorem.

(10) Examples. Hitting, kicking, catching, jumping, diving, collision etc.

In all these cases an impulse acts. \(I = \int F \, dt = F_{av} \Delta t = \Delta p = \text{constant}\)

So if time of contact \(At\) is increased, average force is decreased (or diluted) and vice-versa.

(i) In catching a ball a player by drawing his hands backwards increases the time of contact and so, lesser force acts on his hands and his hands are saved from getting hurt.

(ii) China wares are wrapped in straw or paper before packing.
3.10 Law of Conservation of Linear Momentum.

If no external force acts on a system (called isolated) of constant mass, the total momentum of the system remains constant with time.

(i) According to this law for a system of particles \( \vec{F} = \frac{d\vec{p}}{dt} \)

In the absence of external force \( \vec{F} = 0 \) then \( \vec{p} = \text{constant} \)

\[ i.e., \quad \vec{p} = \vec{p}_1 + \vec{p}_2 + \vec{p}_3 + \ldots = \text{constant}. \]

(2) Law of conservation of linear momentum is independent of frame of reference though linear momentum depends on frame of reference. (3) Practical applications of the law of conservation of linear momentum

(i) When a man jumps out of a boat on the shore, the boat is pushed slightly away from the shore,

(ii) A person left on a frictionless surface can get away from it by blowing air out of his mouth or by throwing some object in a direction opposite to the direction in which he wants to move,

(iii) Reckoning of a gun-Tor bullet and gun system, the force exerted by trigger will be internal so the momentum of the system remains unaffected.

3.11 Free Body Diagram

In this diagram the object of interest is isolated from its surroundings and the interactions between the object and the surroundings are represented in terms of forces.

3.12 Apparent Weight of a Body in a Lift.

When a body of mass \( m \) is placed on a weighing machine which is placed in a lift, then actual weight of the body is \( mg \).

This acts on a weighing machine which offers a reaction \( R \) given by the reading of weighing machine. The reaction exerted by the surface of contact on the body is the apperent weight of the body.

3.13 Acceleration of Block on Horizontal Smooth Surface.

(i) When a pull is acting at an angle (θ) to the horizontal (upward)
\[ R + F \sin \theta = mg \]
\[ R = mg - F \sin \theta \]
and \[ F \cos \theta = ma \]
\[ a = \frac{F \cos \theta}{m} \]

3.14 Acceleration of Block on Smooth Inclined Plane

(1) When inclined plane is at rest Normal reaction \[ R = mg \cos \theta \] Force along a inclined plane \[ F = mg \sin \theta \]
\[ ma = mg \sin \theta \]
\[ a = g \sin \theta \]

(2) When a inclined plane given a horizontal acceleration 'b'. Since the body lies in an accelerating frame, an inertial acts on it in the opposite direction.
Normal reaction \[ R = mg \cos \theta + mb \sin \theta \]
and \[ ma = mg \sin \theta - mb \cos \theta \]
\[ a = g \sin \theta - b \cos \theta \]

### 3.18 Friction [Introduction.]

If we slide or try to slide a body over a surface the motion is resisted by a bonding between the body and the surface. This resistance is represented by a single force and is called friction.

The force of friction is parallel to the surface and opposite to the direction of intended motion.

### 3.19 Types of Friction

1. **Static friction**: The opposing force that comes into play when objects are at rest.
   - (i) In this case static friction \( F = P \).
   - (ii) Static friction is a self-adjusting force because it changes itself in accordance with the applied force.
(2) **Limiting friction** - The maximum value of static friction upto which body does not move is called limiting friction.

(i) The magnitude of limiting friction between any two bodies in contact is directly proportional to the normal reaction between them.

\[ F_1 \propto R \text{ or } F_1 = u_s R \]

(ii) Direction of the force of limiting friction is always opposite to the direction in which one body is at the verge of moving.

(iii) Coefficient of static friction:

(a) \( \mu_s \) is called coefficient of static friction.

(b) Dimension: \([M^0L^0T^0]\)

(c) Unit: It has no unit.

(d) Value of \( \mu_s \) lies in between 0 and 1

(e) Value of \( \mu \) depends on material and nature of surfaces in contact.

(f) Value of \( \mu \) does not depend upon apparent area of contact.

(3) **Kinetic or dynamic friction** - If the applied force sets the body in motion, the friction opposing the motion is called kinetic friction.

(i) Kinetic friction depends upon the normal reaction.

\[ F_k \propto R \text{ or } F_k = \mu_k R \]

where \( \mu_k \) is called the coefficient of kinetic friction.

(ii) Kinetic friction is always lesser than limiting friction \( F_k < F_1 : \mu_k < \mu_s \)

Thus we require more force to start a motion than to maintain it against friction. This is because when motion has actually started, irregularities of one surface have little time to get locked again into the irregularities of the other surface.

(iv) Types of kinetic friction: (a) Sliding friction (b) Rolling friction
- Rolling friction is directly proportional to the normal reaction \( (R) \) and inversely proportional to the radius \((r)\) of the rolling cylinder or wheel.

\[
F_{\text{rolling}} = \mu \frac{R}{r}
\]

\( \mu \) is called coefficient of rolling friction. It would have the dimensions of length and would be measured in metre.

- Rolling friction is often quite small as compared to the sliding friction.
- In rolling the surfaces at contact do not rub each other.
- The velocity of point of contact with respect to the surface remains zero all the times.

3.20 Graph Between Applied Force and Force of Friction

(1) Part OA = static friction \( (F_s) \).

(2) At point A = limiting friction \( (F_l) \).

(3) Beyond A, the force of friction is seen to decrease slightly.

The portion BC = kinetic friction \( (F_k) \).

(4) As the portion BC of the curve is parallel to x axis therefore kinetic friction does not change with the applied force.

3.21 Angle of Friction.

Angle of friction may be defined as the angle which the resultant limiting friction and normal reaction makes with the normal reaction.

By definition angle \( \theta \) is called the angle of friction

\[
\tan \theta = \frac{F}{R}
\]
\[ \tan \theta = \mu \]  
\[ \text{[As we know} \quad \frac{F}{R} = \mu \]

or  
\[ \theta = \tan^{-1}(\mu) \]

3.22 Angle of Repose

Angle of repose is defined as the angle of the inclined plane with horizontal such that a body placed on it is just begins to slide.

If \( \alpha \) is called the angle of repose.

\[ \alpha = \theta \quad i.e. \quad \text{angle of repose} = \text{angle of friction.} \]

UNIT - III - LAWS OF MOTION

I MARK QUESTIONS

1. A passenger sitting in a car at next, pusher the car from within. The car doesn’t move, why?
2. Give the magnitude and directions of the net force acting on a rain drop falling with a constant speed.
3. Why the passengers in a moving car are thrown outwards when it suddenly takes a turn?
4. What is the purpose of using shockers in a car?
5. Why are tyres made of rubber not of steel?
6. Wheels are made circular. Why?
7. A force is required to keep a body in uniform motion in a straight line. Comments.
8. On a rainy day skidding takes place along a curved path. Why?
9. Why does a gun recoils when a bullet is being fired?
10. Why is it difficult to catch a cricket ball than a tennis ball even when both are moving with the same velocity?
11. Calculate the impulse necessary to stop a 1500 kg car moving at a speed of 25 ms\(^{-1}\).
\((-37500 \text{ N–S})\)

12. Lubricants are used between the two parts of a machine. Why?

13. What provides the centripetal force to a car taking a turn on a level road?

14. What is an inertial frame of reference?

15. An athlete runs a certain distance before taking a long jump. Why?

16. Action and reaction forces do not balance each other. Why?

17. The wheels of vehicles are provided with mudguards. Why?

18. China wares are wrapped in straw paper before packing.

19. Why is it difficult to walk on a sand?

20. The outer edge of a curved road is generally raised over the inner edge. Why?

21. Explain why the water doesn’t fall even at the top of the circle when the bucket full of water is upside down rotating in a vertical circle?

22. Why does a speedy motorcyclist bends towards the centre of a circular path while taking a turn on it?

23. If the net force acting upon the particle is zero show that its linear momentum remains constant?

2 MARKS QUESTIONS

25. A man getting out of a moving bus runs in the same direction for a certain distance. Comment.

26. The motion of a particle of mass \(m\) is described by \(h = ut + \frac{1}{2}gt^2\). Find the force acting on particle.
\((F = mg)\)

27. It is difficult to push a box full of clothes than an empty box. Explain.
28. A particle of mass 0.3 kg is subjected to a force of $F = -kx$ with $k = 15$ Nm$^{-1}$. What will be its initial acceleration if it is released from a point 20 cm away from the origin? 
(a = $-10$ ms$^{-2}$)

29. A 50 g bullet is fired from a 10 kg gun with a speed of 500 ms$^{-1}$. What is the speed of the recoil of the gun. 
(2.5 ms$^{-1}$)

30. A block of mass $M$ is pulled along a horizontal frictionless surface by a rope of mass $m$ by applying a force $P$ at the free end of the rope. Find the force exerted by the rope on the block.

Ans : $F = M \left( \frac{P}{M + m} \right)$

31. Three forces $F_1$, $F_2$ and $F_3$ are acting on the particle of mass $m$ which is stationary. $F_2$ is perpendicular to $F_1$ if $F_1$ is removed, what will be the acceleration of particle? 
(a = $F_i/m$)

32. A spring balance is attached to the ceiling of a lift. When the lift is at rest spring balance reads 49 N of a body hang on it. If the lift moves :-

(i) Downward
(ii) upward, with an acceleration of 5 ms$^{-2}$
(iii) with a constant velocity.

What will be the reading of the balance in each case? 
(24N, 74 N, 49N)

33. It is easier to pull a roller than to push it. Why?

34. A horse cannot pull a cart and run in empty space. Why?

35. A bob of mass 0.1 kg hung from the ceiling of room by a string 2 m long is oscillating. At its mean position the speed of the bob is 1 ms$^{-1}$. What is the trajectory of the oscillating bob if the string is cut when the bob is

(i) At the mean position Ans : (Parabolic)
(ii) At its extreme position. Ans : (vertically downwards)
36. Define force of friction? How does ball bearing reduce friction?

37. Is larger surface area brake on a bicycle wheel more effective than smaller surface area brake? Explain?

38. Define angle of friction and angle of repose.

39. A block placed on a rough horizontal surface is pulled by a horizontal force $F$. Let $f$ be the force applied by the rough surface on the block. Plot a graph of $f$ versus $F$.

40. A mass of 2 kg is suspended with thread AB. Thread CD of the same type is attached. To the other end of 2 kg mars.

(i) Lower end of the lower thread is pulled gradually, hander and hander is the downward direction so as to apply force on AB. Which of the thread will break & why?

(ii) If the lower thread is pulled with a jerk, what happens?

41. A block of mars M is held against a rough vertical wall by pressing it with a finger. If the coefficient of friction between the block and the wall is $u$ and the deceleration due to gravity is $g$, calculate the minimum force required to be applied by the finger to hold the block against the wall?

3 MARKS QUESTIONS

42. A block of mass 500g is at rest on a horizontal table. What steady force is required to give the block a velocity of 200 cms$^{-1}$ in 4 s?

43. A force of 98 N is just required to move a mass of 45 kg on a rough horizontal surface. Find the coefficient of friction and angle of friction? (0.22, 12°24')

44. Calculate the force required to move a train of 200 quintal up on an incline plane of 1 in 50 with an acceleration of 2 ms$^{-2}$. The force of friction per quintal is 0.5 N. (40200N0)
45. An aeroplane requires to take off a speed of 80 km h\(^{-1}\) on a runway of 100m. Mass of the plane is 10000 kg and coefficient of friction between the plane and the ground is 0.2. If the acceleration of the plane is uniform during take off, Calculate the minimum force required by the engine for the take off. (27.13 N)

46. A smooth block is released from rest on a 30° incline and travels a distance d. If the time taken to slide on a rough 30° inclined surface is n times large to cover the same distance on a smooth incline. Find the coefficient of friction?

\[ \frac{1}{\sqrt{3}} \left( \frac{1}{n-1} \right) \]

47. What is the acceleration of the block and trolley system as in fig., if the coefficient of kinetic friction between the trolley and the surface is 0.04? Also calculate tension in the string. Take g = 10 ms\(^{-2}\), mass of string is negligible. (0.957 ms\(^{-2}\), 27.13 N)

48. Three blocks of masses \( m_1 = 10 \) kg, \( m_2 = 20 \) kg and \( m_3 = 30 \) kg are connected by strings on smooth horizontal surface and pulled by a force of 60 N. Find the acceleration of the system and tensions in the string.

\( 1 \text{ms}^{-2} T_1 = 10\text{N}, T_2 = 30\text{N} \)

49. A hunter has a machine gun that can fire 50g bullets with a velocity of 150 ms\(^{-1}\). A 60 kg tiger springs at him with a velocity of 10 ms\(^{-1}\). How many bullets must the hunter fire into the target so as to stop him in his track?
Ans. Given, \( m = \) mass of bullet = 50 gm = 0.050 kg
\( M = \) mass of tiger = 60 kg.
\( v = \) velocity of bullet = 150 ms\(^{-1}\)
\( V = \) velocity of tiger = \(-10\) ms\(^{-1}\).

50. A force of 100 N gives a mass \( m_1 \), an acceleration of 10 ms\(^{-2}\) and of 20 ms\(^{-2}\) to a mass \( m_2 \). What acceleration must be given to it if both the masses are tied together?

51. The pulley arrangement of fig. are identical. The mass of the rope is negligible. In (a) mass \( m \) is lifted up by attaching a mars (2\( m \)) to the other end of the rope. In (b), \( m \) is lifted up by pulling the other end of the rope with a constant downward force \( F_2 = 2mg \). In which case, the acceleration of \( m \) is more?

52. Fig. shows the position-time graph of a particle of mass 4 kg. What is the

(a) Force on the particle for \( t < 0 \), \( t > 4s \), \( 0 < t < 4s \)?

(b) Impulse at \( t = 0 \) and \( t = 4s \)?

(Consider one dimensional motion only)
53. A bullet of Mass 0.01 kg is fired horizontally into a 4 kg wooden block at rest on a horizontal surface. The coefficient of kinetic friction between the block and the surface is 0.25. The bullets gets embedded in the block and the combination moves 20m before coming to rest. With what speed did the bullet strike the block?

54. The near side of a truck is open and a box of 40 kg mass is placed 5m away from the open end. The coefficient of friction between the box and the surface below it is 0.15. on a straight road, the truck starts from rest and accelerates with 2 m/s$^2$. At what distance from the starting point does the box fall off the truck (ignore the size of the box)

55. Two masses of 5 kg and 3 kg are suspended with help of mass less inextensible strings as shown. Calculate T1 and T2 when where system is going upwards with acceleration 2 m/s$^2$ (use g = 9.8 m/s$^2$)

56. There are few forces acting at a point P produced by strings as shown, which is at rest. Find the forces F₁ and F₂.
57. A helicopter of mass 2000 kg rises with a vertical acceleration of 15 m/s². The total mass of the crew and passengers is 500 kg. Give the magnitude and direction of the:

(i) Force on the floor of the helicopter by the crew and passenger.
(ii) Action of the rotor of the helicopter on the surrounding air
(iii) Force on the helicopter due to the surrounding air.

58. A rectangular box lies on a rough inclined surface. The coefficient of friction between the surface and the box is μ. Let the mass of the box be m.

(a) At what angle of inclination θ of the plane to the horizontal will the box just start to slide down the plane?
(b) What is the force acting on the box down the plane, if the angle of inclination of the plane is increased to θ > θc?
(c) What is the force needed to be applied upwards along the plane to make the box either remain stationary or just move up with uniform speed?
(d) What is the force needed to be applied upwards along the plane to make the box move up the plane with acceleration a?

### 5 MARKS QUESTIONS

60. Why circular roads are banked? Derive an expression for angle of banking for safe circular turn?

62. Obtain an expression for minimum velocity of projection of a body at the lowest point for Looping a vertical loop.

63. Show that the area under the force-time graph gives the magnitude of the impulse of the given force for the following case when (i) force is constant (ii) variable force.

64. Derive an expression for acceleration of a body down a rough inclined plane? (Sliding only)
Ans. 39.  

- Upto point A, \( f = F \) (50 Long as block is stationary)  
- beyond A, when \( F \) increases, block starts moving \( f \) remains constant.

Ans. 40.  
(i) Thread AB breaks down  
(ii) CD will break

Ans. 41.  

For the block not to fall \( f = Mg \)  
But \( f = \mu R = \mu F \) so  
\[ \mu F = Mg \]  
\[ F = \frac{Mg}{\mu} \]
Ans49. Given \( m \) = mass of bullet = 50gm = 0.050kg

\( M \) = mass of tiger = 60kg

\( v \) = Velocity of bullet = 150m/s

\( V \) = Velocity of tiger = -10m/s

('. it is coming from opposite direction \( n \) = no. of bullets fired per second at the tiger so as to stop it.)

\[ P_i = 0, \text{ before firing} \quad \ldots \ldots \text{(i)} \]

\[ P_f = n(mv) + MV \quad \ldots \ldots \text{(ii)} \]

.'. From the law of conservation of momentum,

\[ P_i = p_f \]

\[ 0 = n(mv) + MV \]

\[ \Rightarrow n = \frac{MV}{mv} \]

\[ = \frac{-60 \times (-10)}{0.05 \times 150} \]

\[ = 80. \]

Ans.50. Suppose, \( a\) = acceleration produced if \( m_1 \) and \( m_2 \) are tied together,

\( F = 100 \text{ N.} \)

Let \( a_1 \) and \( a_2 \) be the acceleration produced in \( m_1 \) and \( m_2 \), respectively.

\[ a_1 = 10 \text{ ms}^{-2} \text{, } a_2 = 20 \text{ ms}^{-2} \text{ (given)} \]

Again \( m_1 = \frac{F}{a_1} \) and \( m_2 = \frac{F}{a_2} \)

\[ \Rightarrow m_1 = \frac{100}{10} = 10\text{ms}^{-2} \]

and \( m_2 = \frac{100}{10} = 5\text{ms}^{-2} \)
\[ \therefore m_1 + m_2 = 10 + 5 15 \]

So, \( a = \frac{F}{m_1 + m_2} = \frac{100}{15} = \frac{20}{3} \)

\[ = 6.67 \text{ ms}^{-2} \]

**Ans 51.** Case (a) \( a = \frac{g}{3} \), case (b) \( a = g \)

**Ans 52.** Refer NCERT

**Ans 53.** Velocity of the bullet before it gets embedded = 3970 m/s

**Ans 54.** 20m (refer NCERT)

**Ans 55.** \( T_1 = 94.4\text{N}, T_2 = 35.4\text{N} \)

**Ans 56.** \( F_1 = \frac{1}{\sqrt{2}}\text{N}, F_2 = \frac{3}{\sqrt{2}}\text{N} \)

**Ans 57.**

(a) \( R_1 = 500(15 + 10)\text{N} = 12.5 \times 10^3 \text{ N} \)

(b) \( R_2 = (2000 + 500) (15 + 10)\text{N} = 6.25 \times 10^4\text{N} \)

(c) \( R_3 = 6.25 \times 10^4\text{N} \) (upwards)

**Ans 58.**

(a) \( \theta = \tan^{-1} \mu \)

(b) Force acting on the box slam the plane = \( mg \sin \alpha - \mu \cos \alpha \)

(c) Force needed = \( mg \left( \sin \alpha + \mu \cos \alpha \right) \)

(d) Force needed = \( mg \left( \sin \alpha + \mu \cos \alpha \right) + ma. \)
UNIT 4

WORK, ENERGY AND POWER

4.1 Introduction

Work is said to be done when a force applied on the body displaces the body through a certain distance in the direction of force.

4.2 Work Done by a Constant Force

Let a constant force $F$ be applied on the body such that it makes an angle $\theta$ with the horizontal and body is displaced through a distance $s$

Then work done by the force in displacing the body through a distance $s$ is given by

$$W = (F \cos \theta)s = Fs \cos \theta$$

$$W = F \cdot s$$

4.3 Nature of Work Done

<table>
<thead>
<tr>
<th>Positive work</th>
<th>Negative work</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive work means that force (or its component) is parallel to displacement $0^\circ \leq \theta &lt; 90^\circ$</td>
<td>Negative work means that force (or its component) is opposite to displacement i.e. $90^\circ &lt; \theta \leq 180^\circ$</td>
</tr>
<tr>
<td>$F$ $\rightarrow$ $s$ Direction of motion</td>
<td>$F$ $\rightarrow$ $\vec{s}$ Direction of motion</td>
</tr>
</tbody>
</table>

The positive work signifies that the external force favours the motion of the body. The negative work signifies that the external force opposes the motion of the body.
4.4 Work Done by a Variable Force

When the magnitude and direction of a force varies with position, the work done by such a force for an infinitesimal displacement is given by \( dW = \mathbf{F} \cdot d\mathbf{s} \).

The total work done in going from \( A \) to \( B \) is \( W = \int_{A}^{B} \mathbf{F} \cdot d\mathbf{s} = \int_{A}^{B} (F \cos \theta) \, ds \).

Area under force displacement curve with proper algebraic sign represents work done by the force.

4.5 Work Depends on Frame of Reference.

With change of frame of reference (inertial) force does not change while displacement may change. So the work done by a force will be different in different frames.

*Examples:* If a person is pushing a box inside a moving train, the work done in the frame of train will be \( \mathbf{F} \cdot \mathbf{s} \) while in the frame of earth will be \( \mathbf{F} \cdot (\mathbf{s} + \mathbf{s}_0) \) where \( \mathbf{s}_0 \) is the displacement of the train relative to the ground.

4.6 Energy

The energy of a body is defined as its capacity for doing work.

1. It is a scalar quantity.
2. Dimension: \([ML^2T^2]\) it is same as that of work or torque.
3. Units: \(\text{Joule} \ [\text{S.I.}], \ \text{erg} \ [\text{C.G.S.}]\)
   - Practical units: electron volt (\(eV\)), Kilowatt hour (\(KWh\)), Calories (\(Cal\))
   - Relation between different units: \(1 \ \text{Joule} = 10^7 \ \text{erg}\)
     \(1 \ \text{eV} = 1.6 \times 10^{-19} \ \text{Joule}\)
     \(1 \ \text{KWh} = 3.6 \times 10^6 \ \text{Joule}\)
     \(1 \ \text{Calorie} = 4.18 \ \text{Joule}\)
4. Mass energy equivalence: The relation between the mass of a particle \(m\) and its equivalent energy is given as \(E = mc^2\) where \(c =\) velocity of light in vacuum.
4.7 Kinetic Energy

The energy possessed by a body by virtue of its motion is called kinetic energy.

Let \( m = \text{mass of the body}, \quad v = \text{velocity of the body} \) \( W = -mv^2 \)

1. **Kinetic energy depends on frame of reference:** The kinetic energy of a person of mass \( m \), sitting in a train moving with speed \( v \), is zero in the frame of train but \( \frac{1}{2}mv^2 \) in the frame of the earth.

2. **Work-energy theorem:** It states that work done by a force acting on a body is equal to the change produced in the kinetic energy of the body.

   This theorem is valid for a system in presence of all types of forces (external or internal, conservative or non-conservative).

3. **Relation of kinetic energy with linear momentum:** As we know

   Momentum \( P = \frac{2E}{v} = \sqrt{2mE} \)

4. **Various graphs of kinetic energy**

4.8 Potential Energy

<table>
<thead>
<tr>
<th>Graph 1</th>
<th>Graph 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Graph 1](E \propto v^2 \quad m = \text{constant})</td>
<td>![Graph 2](E \propto P^2 \quad m = \text{constant})</td>
</tr>
<tr>
<td>![Graph 3](E \propto \frac{1}{m} \quad P = \text{constant})</td>
<td>![Graph 4](\sqrt{E} \quad m = \text{constant})</td>
</tr>
</tbody>
</table>

| ![Graph 5](\sqrt{E} \quad p \propto \sqrt{E} \quad m = \text{constant}) |

[Class XI : Physics] 100
4.9 Potential Energy

Potential energy is defined only for conservative forces. In the space occupied by conservative forces every point is associated with certain energy which is called the energy of position or potential energy. Potential energy generally are of three types: Elastic potential energy, Electric potential energy and Gravitational potential energy etc.

(1) **Change in potential energy:** Change in potential energy between any two points is defined in the terms of the work done by the force in displacing the particle between these two points without any change in kinetic energy.

\[ U_2 - U_1 = -\int_{r_1}^{r_2} F \cdot d\bar{r} = -W \]

\[ \ldots \ldots \ (i) \]

(2) **Potential energy curve** :- A graph plotted between the potential energy of a particle and its displacement from the centre of force is called potential energy curve. Negative gradient of the potential energy gives force.

\[ -\frac{dU}{dx} = F \]

(5) **Types of equilibrium:** If net force acting on a particle is zero, it is said to be in equilibrium.

For equilibrium \[ \frac{dU}{dx} = 0 \], but the equilibrium of particle can be of three types:

<table>
<thead>
<tr>
<th>Stable</th>
<th>Unstable</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a particle is displaced slightly from a position, then a force acting on it brings it back to the initial position, it is said to be in stable equilibrium position.</td>
<td>When a particle is displaced slightly from a position, then a force acting on it tries to displace the particle further away from the equilibrium position, it is said to be in unstable equilibrium.</td>
<td>When a particle is slightly displaced from a position then it does not experience any force acting on it and continues to be in equilibrium in the displaced position, it is said to be in neutral equilibrium.</td>
</tr>
<tr>
<td>Potential energy is minimum.</td>
<td>Potential energy is maximum.</td>
<td>Potential energy is constant.</td>
</tr>
<tr>
<td>[ F = -\frac{dU}{dx} = 0 ]</td>
<td>[ F = -\frac{dU}{dx} = 0 ]</td>
<td>[ F = \frac{dU}{dx} = 0 ]</td>
</tr>
</tbody>
</table>
Stable | Unstable | Neutral
---|---|---
\( \frac{d^2U}{dx^2} = \text{positive} \) | \( \frac{d^2U}{dx^2} = \text{negative} \) | \( \frac{d^2U}{dx^2} = 0 \)
\( i.e. \) rate of change of \( \frac{dU}{dx} \) is positive. | \( i.e. \) rate of change of \( \frac{dU}{dx} \) is negative. | \( i.e. \) rate of change of \( \frac{dU}{dx} \) is zero.

**Example:** A marble placed at the bottom of a hemispherical bowl.  
**Example:** A marble balanced on top of a hemispherical bowl.  
**Example:** A marble placed on horizontal table.

### 4.10 Elastic Potential Energy.

1. **Restoring force and spring constant**
   
   When a spring is stretched or compressed from its normal position \((x = 0)\) by a small distance \(x\), a restoring force is produced in the spring to bring it to the normal position. According to Hooke’s law this restoring force is proportional to the displacement \(x\) and its direction is always opposite to the displacement.

   \[ F \propto x \]

   \( i.e. \quad F = k \, x \quad . . . . . (i) \)

   where \(k\) is called spring constant.

2. **Expression for elastic potential energy**

   \[ U = \frac{1}{2} kx^2 = \frac{1}{2} Fx = \frac{F^2}{2k} \]
Note:

- If spring is stretched from initial position \( x_1 \) to final position \( x_2 \) then work done = Increment in elastic potential energy

\[
\frac{1}{2} k \left( x_2^2 - x_1^2 \right)
\]

(3) **Energy graph for a spring**: It mean kinetic energy changes parabolically w.r.t. position but total energy remain always constant irrespective to position of the mass.

(1) **Law of conservation of energy**: For an isolated system or body in presence of conservative forces the sum of kinetic and potential energies at any point remains constant throughout the motion. It does not depends upon time. This is known as the law of conservation of mechanical energy.

(2) **Law of conservation of total energy**: If the forces are conservative and non-conservative both, it is not the mechanical energy alone which is conserved, but it is the total energy, may be heat, light, sound or mechanical etc., which is conserved.

4.15 Power

Power of a body is defined as the rate at which the body can do the work.

Average power \( (P_{av.}) = \frac{\Delta W}{\Delta t} = \frac{W}{t} \). Instantaneous power \( (P_{inst}) = \frac{dW}{dt} = \frac{\vec{F} \cdot d\vec{s}}{dt} \)

[As \( dW = \vec{F} \cdot d\vec{s} \)]

\( P_{inst} = \vec{F} \cdot \vec{v} \).

*i.e. power is equal to the scalar product of force with velocity.*

(1) Dimension: \([P] = [ML^2T^{-3}]\)

(2) Units: **Watt or Joule/sec** [S.I.]

Practical units: Kilowatt \((kW)\), Mega watt \((MW)\) and Horse power \((hp)\)

Relations between different units: 1 watt = 1 Joule/sec = \(10^7\) erg/sec

\(1hp = 746\) Watt
(3) The slope of work time curve gives the instantaneous power. As $P = \frac{dW}{dt} = \tan \theta$

(4) Area under power time curve gives the work done as $P = \frac{dW}{dt}$

\[ \therefore W = \int P \, dt \]

\[ \therefore W = \text{Area under } P \, t \text{ curve} \]

4.12 Collision

Collision is an isolated event in which a strong force acts between two or more bodies for a short time as a result of which the energy and momentum of the interacting particle change.

In collision particles may or may not come in real touch

(3) **Types of collision**: (i) On the basis of conservation of kinetic energy.

<table>
<thead>
<tr>
<th>Perfectly elastic collision</th>
<th>Inelastic collision</th>
<th>Perfectly inelastic collision</th>
</tr>
</thead>
<tbody>
<tr>
<td>If in a collision, kinetic energy after collision is equal to kinetic energy before collision, the collision is said to be perfectly elastic.</td>
<td>If in a collision kinetic energy after collision is not equal to kinetic energy before collision, the collision is said to inelastic.</td>
<td>If in a collision two bodies stick together or move with same velocity after the collision, the collision is said to be perfectly inelastic.</td>
</tr>
<tr>
<td>Coefficient of restitution $\theta = 1$</td>
<td>Coefficient of restitution $0 &lt; \theta &lt; 1$</td>
<td>Coefficient of restitution $\theta = 0$</td>
</tr>
</tbody>
</table>

$(KE)_{\text{final}} = (KE)_{\text{initial}}$ Here kinetic energy appears in other forms. In some cases $(KE)_{\text{final}} < (KE)_{\text{initial}}$ such as when initial KE is converted into internal energy of the product (as heat, elastic or excitation) while in other cases $(KE)_{\text{final}} > (KE)_{\text{initial}}$ such as when internal energy stored in the colliding particles is released.

The term ‘perfectly inelastic’ does not necessarily mean that all the initial kinetic energy is lost, it implies that the loss in kinetic energy is as large as it can be. (Consistent with momentum conservation).
4.13 Perfectly Elastic Head on Collision.

Let two bodies of masses \( m_1 \) and \( m_2 \) moving initial velocities \( u_1 \) and \( u_2 \) in the same direction collide such that after collision their final velocities are \( v_1 \) and \( v_2 \) respectively.

According to law of conservation of momentum and conservation of kinetic energy.

Note:

- The ratio of relative velocity of separation and relative velocity of approach
  \[ e = \frac{v_2 - v_1}{u_1 - u_2} \text{ or } v_2 - v_1 = e(u_1 - u_2) \]
  is defined as coefficient of restitution.

- For perfectly elastic collision \( e = 1 \)  \( \therefore v_2 - v_1 = u_1 - u_2 \) (As shown in eq. (vi)

- For perfectly inelastic collision \( e = 0 \)  \( \therefore v_2 - v_1 = 0 \text{ or } v_2 = v_1 \)
  It means that two body stick together and move with same velocity.

- For inelastic collision \( 0 < e < 1 \)  \( \therefore v_2 - v_1 = (u_1 - u_2) \)
  In short we can say that \( e \) is the degree of elasticity of collision and it is dimension less quantity.

\[
\begin{align*}
  v_1 &= \left( \frac{m_1 - m_2}{m_1 + m_2} \right) u_1 + \frac{2m_1 u_2}{m_1 + m_2} \quad \ldots \ldots \ldots \text{(vii)} \\
  v_2 &= \left( \frac{m_2 - m_1}{m_1 + m_2} \right) u_1 + \frac{2m_2 u_1}{m_1 + m_2} \quad \ldots \ldots \ldots \text{(viii)}
\end{align*}
\]
When two bodies of equal masses undergo head on elastic collision, their velocities get interchanged.

(2) **Kinetic energy transfer during head on elastic collision.** Fractional decrease in kinetic energy

\[
\frac{\Delta K}{K} = \frac{4m_1m_2}{(m_1-m_2)+4m_1m_2} \quad \ldots \ldots \text{(iv)}
\]

**Note:**

- Greater the difference in masses less will be transfer of kinetic energy and vice versa
- Transfer of kinetic energy in head on elastic collision (when target is at rest) is maximum when the masses of particles are equal.

### 2.14 Motion in Vertical Circle.

This is an example of non-uniform circular motion. In this motion body is under the influence of gravity of earth.

1. **Velocity at any point on vertical loop:** If \( u \) is the initial velocity imparted to body at lowest point then. Velocity of body at height \( h \) is given by

\[
v = \sqrt{u^2 - 2gh} = \sqrt{u^2 - 2gl(1 - \cos \theta)}
\]

where \( l \) in the length of the string

2. **Tension at any point on vertical loop:** Tension at general point \( P \), \( T = m g \cos \theta + \frac{mv^2}{l} \)

3. **Various conditions for vertical motion:**

<table>
<thead>
<tr>
<th>velocity at lowest point</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>( u_l &gt; \sqrt{5gl} )</td>
<td>Tension in the string will not be zero at any of the point and body will continue the circular motion.</td>
</tr>
</tbody>
</table>
1. Define the conservative and non conservative forces. Give examples of each.

2. A light body and a heavy body have same linear momentum. Which one has greater K.E? (Ans. : lighter body has more K.E.)

3. The momentum of the body is doubled what % does its K.E change? [Ans : (300%)]

### VERY SHORT ANSWER QUESTION (MARK I)

(6) **Various quantities for a critical condition in a vertical loop at different positions:**

4. A body is moving along a circular path. How much work is done by the centripetal force?

5. Which spring has greater value of spring constant - a hard spring or a delicate spring?

6. Two bodies stick together after collision. What type of collision is in b/w these two bodies?

7. State the two conditions under which a force does no work?

8. How will the momentum of a body changes if its K.E is doubled?

9. K.E of a body is increased by 300 %. Find the % increase in its momentum? (100%)

10. A light and a heavy body have same K.E. which of the two have more momentum and why? (heavier body)

11. Mountain roads rarely go straight up the slop, but wind up gradually. Why?

12. A truck and a car moving with the same K.E on a straight road. Their engines are simultaneously switched off which one will stop at a lesser distance?

13. What happens to the P.E of a bubble when it rises in water? (decrease)

14. A body is moving at constant speed over a friction surface. What is the work done by the weight of the body? (W = 0)

15. Is it necessary that work done in the motion of a body over a closed loop is zero for every force in nature? Why?

16. Define spring constant of a spring?

17. What happens when a sphere collides head on elastically with a sphere of same mass initially at rest?

**SHORT ANSWER QUESTIONS (2 MARKS)**

18. A elastic spring is compressed by an amount x. Show that its P.E. is 1/2 kx² Where k is the spring constant?
19. Derive an expression for the K.E. of a body of mass $m$ moving with a velocity $v$ by calculus method.

20. Show that the total mechanical energy of a body falling freely under gravity is conserved. Show the variation of K.E., RE. and Total Energy with height from the earth surface.

21. How high must a body be lifted to gain an amount of RE equal to the K.E it has when moving at speed 20 ms$^{-1}$. (The value of acceleration due to gravity at a place is 9.8 ms$^{-2}$).\[(20.2\, \text{m})\]

22. A car of mass 2000 kg is lifted up a distance of 30 m by a crane in 1 min. A second crane does the same job in 2 min. Do the cranes consume the same or different amounts of fuel? What is the power supplied by each crane? Note that power dissipation against friction.

23. Prove that bodies of identical masses exchange their velocities after head-on elastic collision.

24. A bob is pulled sideway so that string becomes parallel to horizontal and released. Length of the pendulum is 2 m. If due to air resistance loss of energy is 10% what is the speed with which the bob arrived at the lowest point.

25. Two springs A and B are identical except that A is harder than B ($K_A > K_B$) if these are stretched by the equal force. In which spring will more work be done?

26. Answer the following:

(a) The casing of a rocket in flight burns up due to friction. At whose expense is the heat energy required for burning obtained? The rocket or the atmosphere or both?

(b) Comets move around the sun in highly elliptical orbits. The gravitational force on the comet due to the sun is not normal to the comet's velocity in general. Yet the work done by the gravitational force over every complete orbit of the comet is zero. Why?

27. Find the work done if a particle moves from position $r_1 = (3\hat{i}+2\hat{j}-6\hat{k})$ to a position $r_2 = (14\hat{i}+13\hat{j}-9\hat{k})$ under the effect of force $\vec{F} = (4\hat{i}+\hat{j}+3\hat{k})\text{N.}$
28. Define elastic and inelastic collision. A lighter body collides with a much more massive body at rest. Prove that the direction of lighter body is reserved and massive body remains at rest.

29. A car of mass 1000 kg accelerates uniformly from rest to a velocity of 54 km h\(^{-1}\) in 5 seconds. Calculate (i) its acceleration (ii) its gain in K.E. (iii) average power of the engine during this period, neglect friction.

[Ans. (i) 3 ms\(^{-2}\) (ii) 1.125 × 10\(^5\) J (iii) 22500 W]

30. A ball at rest is dropped from a height of 12 m. It loses 25% of its kinetic energy in striking the ground, find the height to which it bounces. How do you account for the loss in kinetic energy?

31. 20 J work is required to stretch a spring through 0.1 m. Find the force constant of the spring. If the spring is further stretched through 0.1m. Calculate work done.

(4000 Nm\(^{-1}\), 60 J)

32. A body of mass M at rest is struck by a moving body of mass m. Prove that fraction of the initial K.E. of the mass m transferred to the struck body is \(\frac{4m}{M(M+m)^2}\) in an elastic collision.

33. A pump on the ground floor of a building can pump up water to fill a tank of volume 30m\(^3\) in 15 min. If the tank is 40 m above the ground, how much electric power is consumed by the pump. The efficiency of the pump is 30%.

(43.567 KW)

34. How much work is done by a collie walking on a horizontal platform with a load on his head?

35. Spring A and B are identical except that A is stiffer than B, i.e., force constant \(k_A > k_B\). In which spring is more work expended if they are stretched by the same amount?

36. State and prove Work Energy Theorem.

37. Show that in an elastic one dimensional collision the relative velocity of approach before collision is equal to the relative velocity of separation after collision.

38. Show that in a head on collision between two balls of equal masses moving along a straight line the balls exchange their velocities.
39. Which of the two kilowatt hour or electron volt is a bigger unit of energy and by what factor?

40. A spring of force constant K is cut into two equal pieces. Calculate force constant of each part.

41. It is necessary that work done in the motion of a body over a closed loop is zero for every force in nature? Why?

42. A spring is first stretched by x by applying a force F. Now the extension of the spring is increases to 3x. What will be the new force required to keep the spring in this condition? Calculate the work done in increasing the extension.

**LONG ANSWER QUESTIONS (5 MARKS)**

43. Show that at any instant of time during the motion total mechanical energy of a freely falling body remains constant. Show graphically the variation of K.E. and P.E. during the motion.

44. Define spring constant, Write the characteristics of the force during the elongation of a spring. Derive the relation for the PE stored when it is elongated by X. Draw the graphs to show the variation of P.E. and force with elongation.

45. How does a perfectly inelastic collision differ from perfectly elastic collision? Two particles of mass m_1 and m_2 having velocities U_1 and U_2 respectively make a head on collision. Derive the relation for their final velocities. Discuss the following special cases.

   (i) m_1 = m_2
   (ii) m_1 >> m_2 and U_2 = 0
   (iii) m_1 << m_2 and u_1 = 0

**NUMERICALS**

46. A body is moving along z-axis of a coordinate system under the effect of a constant force \( F = (2\hat{i} + 3\hat{j} - \hat{k}) \text{N} \). Find the work done by the force in moving the body a distance of 2 m along \( z \)-axis.
47. In lifting a 10 kg weight to a height of 2m, 230 J energy is spent. Calculate the acceleration with which it was raised?

48. A bullet of mass 0.02 kg is moving with a speed of 10ms\(^{-1}\). It can penetrate 10 cm of a wooden block, and comes to rest. If the thickness of the target would be 6 cm only find the KE of the bullet when it comes out.

\(\text{(Ans : 0.4 J)}\)

49. A man pulls a lawn roller with a force of 20 kg F. If he applies the force at an angle of 60° with the ground. Calculate the power developed if he takes 1 min in doing so.

50. A ball bounces to 80% of its original height. Calculate the mechanical energy lost in each bounce.

51. A pendulum bob of mass 0.1 kg is suspended by a string of 1 m long. The bob is displaced so that the string becomes horizontal and released. Find its kinetic energy when the string makes an angle of (i) 0°, (ii) 30° with the vertical.

52. A truck of mass 1000 kg accelerates uniformly from rest to a velocity of 15ms\(^{-1}\) in 5 seconds. Calculate (i) its acceleration (ii) its gain in K.E. (iii) average power of the engine during this period, neglect friction.

\[\text{[Ans. (i) 3 ms}^{-2}\text{ (ii) 1.125 \times 10^5 J (iii) 22500 W]}\]

53. An elevator which can carry a maximum load of 1800 kg (elevator + passengers) is moving up with a constant speed of 2 ms\(^{-1}\). The frictional force opposing the motion is 4000 N. Determine the minimum power delivered by the motor to the elevator in watts as well as in horse power.

54. The simulate car accidents, auto manufacturers study the collisions of moving cars with mounted springs of different spring constants. Consider a typical simulation with a car of mass 1000 kg moving with a speed 18.0 kmh\(^{-1}\) on a smooth road and colliding with a horizontally mounted spring of spring constant 6.25 \(\times\) \(10^{-3}\) Nm\(^{-1}\). What is the maximum compression of the spring.

55. A ball at rest is dropped from a height of 12 m. It loses 25% of its kinetic energy in striking the ground, find the height to which it bounces. How do you account for the loss in kinetic energy?
56. A body of mass 0.3 kg is taken up an inclined plane to length 10 m and height 5 m and then allowed to slide down to the bottom again. The coefficient of friction between the body and the plane is 0.15. What is the

(i) work done by the gravitational force over the round trip.

(ii) work done by the applied force over the upward journey.

(iii) work done by frictional force over the round trip.

(iv) kinetic energy of the body at the end of the trip.

How is the answer to (iv) related to the first three answer?

57. Two identical 5 kg blocks are moving with same speed of 2 ms\(^{-1}\) towards each other along a frictionless horizontal surface. The two blocks collide, stick together and come to rest. Consider the two blocks as a system. Calculate work done by (i) external forces and (i) Internal forces.
5.1 Introduction

*Rigid body:* A rigid body is a body that can rotate with all the parts locked together and without any change in its shape.

5.2 Centre of Mass.

Centre of mass of a system is a point that moves as though all the mass were concentrated there and all external forces were applied there.

(1) **Position vector of centre of mass for n particle system:** If a system consists of $n$ particles of masses $m_1, m_2, m_3, \ldots, m_n$, whose position vectors are $\vec{r}_1, \vec{r}_2, \vec{r}_3, \ldots, \vec{r}_n$ respectively then position vector of centre of mass

$$\vec{r} = \frac{m_1 \vec{r}_1 + m_2 \vec{r}_2 + m_3 \vec{r}_3 + \ldots + m_n \vec{r}_n}{m_1 + m_2 + m_3 + \ldots + m_n}$$

If two masses are equal *i.e.* $m_1 = m_2$, then position vector of centre of mass

$$\vec{r} = \frac{\vec{r}_1 + \vec{r}_2}{2}$$

(2) **Important points about centre of mass**

(i) The position of centre of mass is independent of the co-ordinate system chosen.

(ii) The position of centre of mass depends upon the shape of the body and distribution of mass.
(iii) In symmetrical bodies in which the distribution of mass is homogenous, the centre of mass coincides with the geometrical centre or centre of symmetry of the body. Centre of mass of Cone or pyramid lies on the axis of the cone at point distance \( \frac{3h}{4} \) from the vertex where \( h \) is the height of cone.

(iv) The centre of mass changes its position only under the translatory motion. There is no effect of rotatory motion on centre of mass of the body.

(v) If the origin is at the centre of mass, then the sum of the moments of the masses of the system about the centre of mass is zero i.e. \( \sum m_i r_i = 0 \).

(vi) If a system of particles of masses \( m_1, m_2, m_3, \ldots \) move with velocities \( v_1, v_2, v_3, \ldots \) then the velocity of centre of mass

\[ v_{cm} = \frac{\sum m_i v_i}{\sum m_i} \]

(vii) If a system of particles of masses \( m_1, m_2, m_3, \ldots \) move with accelerations \( a_1, a_2, a_3, \ldots \) then the acceleration of centre of mass of mass \( A_{cm} = \frac{\sum m_i a_i}{\sum m_i} \).

(viii) If \( \vec{r} \) is a position vector of centre of mass of a system then

velocity of centre of mass \( \vec{v}_{cm} = \frac{d\vec{r}}{dt} \)

(ix) Acceleration of centre of mass \( \vec{A}_{cm} = \frac{d\vec{v}_{cm}}{dt} = \frac{d^2\vec{r}}{dt^2} \).
(x) Force on a rigid body \( \vec{F} = MA.\vec{a} = M \frac{d^2\vec{r}}{dt^2} \)

(xi) For an isolated system external force on the body is zero
\[ \vec{F} = M \frac{d}{dt} (\vec{v}_{cm}) = 0 \]
\[ \Rightarrow \vec{v}_{cm} = \text{constant.} \]
i.e., centre of mass of an isolated system moves with uniform velocity along a straight-line path.

5.6 Equations of Linear Motion and Rotational Motion.

<table>
<thead>
<tr>
<th>Rotational Motion</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>If angular acceleration is 0, ( \omega = ) constant and ( \theta = \omega t )</strong></td>
</tr>
<tr>
<td><strong>If angular acceleration ( \alpha = ) constant then</strong></td>
</tr>
<tr>
<td>(i) ( \theta = \frac{(\omega_1 + \omega_2)}{2} t )</td>
</tr>
<tr>
<td>(ii) ( \alpha = \frac{\omega_2 - \omega_1}{t} )</td>
</tr>
<tr>
<td>(iii) ( \omega_2 = \omega_1 + \alpha t )</td>
</tr>
<tr>
<td>(iv) ( \theta = \omega_1 t + \frac{1}{2} \alpha t^2 )</td>
</tr>
<tr>
<td>(v) ( \omega_2^2 = \omega_1^2 + 2\alpha \theta )</td>
</tr>
<tr>
<td>(vi) ( \theta_{n+1} = \omega_1 + (2n-1) \frac{\alpha}{2} )</td>
</tr>
</tbody>
</table>

If acceleration is not constant, the above equation will not be applicable. In this case
| (i) \( \omega = \frac{d\theta}{dt} \) |
| (ii) \( \alpha = \frac{d\omega}{dt} = \frac{d^2\theta}{dt^2} \) |
| (iii) \( \omega d\omega = \alpha d\theta \) |
5.7 Moment of Inertia.

Moment of inertia plays the same role in rotational motion as mass plays in linear motion. It is the property of a body due to which it opposes any change in its state of rest or of uniform rotation.

1. Moment of inertia of a particle \( I = mr^2 \); where \( r \) is the perpendicular distance of particle from rotational axis.

2. Moment of inertia of a body made up of number of particles (discrete distribution)

\[
I = m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \ldots \ldots \ldots
\]

3. Moment of inertia of a continuous distribution of mass, \( dl = dm \) i.e.,

\[
I = \int r^2 dm
\]

4. Dimension: \([ML^2T^0]\)

5. S.I. unit : \( kgm^2 \).

6. Moment of inertia depends on mass, distribution of mass and on the position of axis of rotation.

7. Moment of inertia is a tensor quantity.

5.8 Radius of Gyration.

Radius of gyration of a body about a given axis is the perpendicular distance of a point from the axis, where if whole mass of the body were concentrated, the body shall have the same moment of inertia as it has with the actual distribution of mass.

When square of radius of gyration is multiplied with the mass of the body gives the moment of inertia of the body about the given axis.

\[
I = Mk^2 \text{ or } k = \sqrt[\frac{I}{M}}.
\]

Here \( k \) is called radius of gyration.

\[
k = \sqrt[\frac{r_1^2 + r_2^2 + r_3^2 + \ldots \ldots \ldots r_n^2}{n}]
\]
Note:

- For a given body inertia is constant whereas moment of inertia is variable.

### 5.9 Theorem Of Parallel Axes.

Moment of inertia of a body about a given axis \( I \) is equal to the sum of moment of inertia of the body about an axis parallel to given axis and passing through centre of mass of the body \( I_g \) and \( Ma^2 \) where \( M \) is the mass of the body and \( a \) is the perpendicular distance between the two axes.

\[
I = I_g + Ma^2
\]

### 5.10 Theorem of Perpendicular Axes.

According to this theorem the sum of moment of inertia of a plane lamina about two mutually perpendicular axes lying in its plane is equal to its moment of inertia about an axis perpendicular to the plane of lamina and passing through the point of intersection of first two axes.

\[
I_z = I_x + I_y
\]

Note:

- In case of symmetrical two-dimensional bodies as moment of inertia for all axes passing through the centre of mass and in the plane of body will be same so the two axes in the plane of body need not be perpendicular to each other.

### 5.12 Analogy between Tranlatory Motion and Rotational Motion.

<table>
<thead>
<tr>
<th>Translatory motion</th>
<th>Rotatory motion</th>

### 5.14 Torque

If the particle rotating in $xy$ plane about the origin under the effect of force $\vec{F}$ and at any instant the position vector of the particle is $\vec{r}$ then,

\[
\text{Torque } \vec{\tau} = \vec{r} \times \vec{F}
\]

\[
\tau = rF \sin \phi
\]

(1) Torque is an axial vector, i.e., its direction is always perpendicular to the plane containing vector $\vec{r}$ and $\vec{F}$ in accordance with right hand screw rule. For a given figure the sense of rotation is anti-clockwise so the...
direction of torque is perpendicular to the plane, outward through the axis of rotation.

\( \text{i.e. Torque} = \text{Force} \times \text{Perpendicular distance of line of action of force from the axis of rotation.} \)

Torque is also called as moment of force and \( d \) is called moment or lever arm.

(2) Unit: **Newton-metre** (M.K.S.) and **Dyne-cm** (C.G.S.)

(3) Dimension: \([ML^2T^{-2}]\).

(4) A body is said to be in rotational equilibrium if resultant torque acting on it is zero \( \text{i.e. } \sum \tau = 0 \).

(5) Torque is the cause of rotatory motion and in rotational motion it plays same role as force plays in translatory motion \( \text{i.e., } \) torque is rotational analogue of force. This all is evident from the following correspondences between rotatory and translatory motion.

<table>
<thead>
<tr>
<th>Rotatory Motion</th>
<th>Translatory Motion</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \tau = \vec{\alpha} )</td>
<td>( \vec{v} = m \vec{a} )</td>

<tr>
<td>( P = \tau \cdot \vec{\omega} )</td>
<td>( \int \vec{F} \cdot \vec{v} )</td>
</tr>
<tr>
<td>( \tau = \frac{dL}{dt} )</td>
<td>( \vec{F} = \frac{dP}{dt} )</td>
</tr>
</tbody>
</table>

### 5.15 Couple

A couple is defined as combination of two equal but oppositely directed force not acting along the same line. The effect of couple is known by its moment of couple or torque by a couple \( \tau = \vec{r} \times \vec{F} \).
5.17 Angular Momentum

The moment of linear momentum of a body with respect to any axis of rotation is known as angular momentum. If \( \vec{P} \) is the linear momentum of particle and \( \vec{r} \) its position vector from the point of rotation then angular momentum.

\[
\vec{L} = \vec{r} \times \vec{P}
\]

\[
\vec{L} = rP \sin \phi \ \hat{n}
\]

Angular momentum is an axial vector i.e. always directed perpendicular to the plane of rotation and along the axis of rotation.

1. S.I. Unit : \( kgm^2s^{-1} \) or \( J–sec. \)
2. Dimension : \([ML^2T^{-2}]\) and it is similar to Planck’s constant (\( h \)).
3. Angular momentum = (Linear momentum) \( \times \) (Perpendicular distance of line of action of force from the axis of rotation)
4. In vector form \( \vec{L} = I \vec{\omega} \)
5. From \( L = I \vec{\omega} \) \( \Rightarrow \) \( \frac{d\vec{L}}{dt} = I \frac{d\vec{\omega}}{dt} = I \vec{a} = \vec{\tau} \)

[Rotational analogue of Newton’s second law]
6. If a large torque acts on a particle for a small time then ‘angular impulse’ of torque is given by \( \vec{J} = \int_{t_1}^{t_2} \vec{\tau} \ dt = \vec{\tau}_{\text{eq}} \int_{t_1}^{t_2} dt \)

\( \therefore \) Angular impulse = Change in angular momentum

5.18 Law of Conservation of Angular Momentum

If the net external torque on a particle (or system) is zero then \( \frac{d\vec{L}}{dt} = 0 \)

\( i.e \) \( \vec{L} = \vec{L}_1 + \vec{L}_2 + \vec{L}_3 + \ldots \ldots \ldots \ldots = \text{constant.} \)
Angular momentum of a system (may be particle or body) remains constant if resultant torque acting on it zero.

As $L = I\omega$ so if $\tau = 0$ then $I\omega = \text{constant}$.

### 5.20 Slipping, Spinning and Rolling

1. **Slipping**: When the body slides on a surface without rotation then its motion is called slipping motion.

   In this condition friction between the body and surface $F = 0$.

   Body possess only translatory kinetic energy $K_T = \frac{1}{2}mv^2$.

2. **Spinning**: When the body rotates in such a manner that its axis of rotation does not move then its motion is called spinning motion. In this condition axis of rotation of a body is fixed.

   In spinning, body possess only rotatory kinetic energy $K_R = \frac{1}{2}I\omega^2$.

3. **Rolling**: If in case of rotational motion of a body about a fixed axis, the axis of rotation also moves, the motion is called combined translatory and rotatory.

   **Example**:

   (i) Motion of a wheel of cycle on a road.

   (ii) Motion of football rolling on a surface.

   In this condition friction between the body and surface $F \neq 0$. Body possesses both translational and rotational kinetic energy.

   Net kinetic energy = (Translatory + Rotatory) kinetic energy.

### 5.21 Rolling Without Slipping

In case of combined translatory and rotatory motion if the object rolls across a surface in such a way that there is no relative motion of object and surface at the point of contact, the motion is called rolling without slipping.
Friction is responsible for this type of motion but work done or dissipation of energy against friction is zero as there is no relative motion between body and surface at the point of contact.

Rolling motion of a body may be treated as a pure rotation about an axis through point of contact with same angular velocity \( \omega \). \( [v = R\omega] \)

**Linear velocity of different points in rolling:** In case of rolling, all points of a rigid body have same angular speed but different linear speed. Let A, B, C and D are four points then their velocities are shown in the following figure.

![Diagram of linear velocity of different points in rolling](image)

5.22 **Rolling on an Inclined Plane.**

When a body of mass \( m \) and radius \( R \) rolls down on inclined plane of height \( h \) and angle of inclination \( \theta \), it loses potential energy. However it acquires both linear and angular speeds and hence, gain kinetic energy of translation and that of rotation.

(1) **Velocity at the lowest point:**

\[
v = \sqrt{\frac{2gh}{1 + \frac{k^2}{R^2}}} \]

(2) **Acceleration in motion:** From equation \( v^2 = u^2 + 2aS \)

By substituting \( u = 0 \), \( S = \frac{h}{\sin \theta} \) and \( v = \sqrt{\frac{2gh}{1 + \frac{k^2}{R^2}}} \) we get
\[ a = \frac{g \sin \theta}{1 + \frac{k^2}{R^2}} \]

(3) **Time of descent** From equation \( v = u + at \)

By substituting \( u = 0 \) and value of \( v \) and \( a \) from above expressions

\[ t = \frac{1}{\sin \theta} \sqrt{\frac{2h}{g \left(1 + \frac{k^2}{R^2}\right)}} \]

## UNIT-V ROTATIONAL MOTION

### ROTATIONAL MOTION (1 MARK)

1. About which axis a uniform cube will have minimum moment of inertia?
2. State the principle of moments of rotational equilibrium.
3. Find the moment of inertia of a disc of radius \( R \) and mass \( m \) about an axis in its plane at a distance \( R/2 \) from its centre.
4. Can the couple acting on a rigid body produce translator motion?
5. Which component of linear momentum does not contribute to angular momentum?
6. A system is in stable equilibrium. What can we say about its potential energy?
7. Is radius of gyration a constant quantity?
8. Two solid spheres of the same mass are made of metals of different densities. Which of them has a large moment of inertia about the diameter?
9. The moment of inertia of two rotating bodies A and B are \( I_A \) and \( I_B \) (\( I_A > I_B \)) and their angular momenta are equal. Which one has a greater kinetic energy?
10. A particle moves on a circular path with decreasing speed. What happens to its angular momentum?
11. What is the value of instantaneous speed of the point of contact during pure rolling?

12. Which physical quantity is conserved when a planet revolves around the sun?

13. What is the value of torque on the planet due to the gravitational force of sun?

14. If no external torque acts on a body, will its angular velocity be constant?

15. Why there are two propellers in a helicopter?

16. A child sits stationary at one end of a long trolley moving uniformly with speed V on a smooth horizontal floor. If the child gets up and runs about on the trolley in any manner, then what is the effect of the speed of the centre of mass of the (trolley + child) system?

**ROTATIONAL MOTION (2 MARKS)**

17. Show that in the absence of any external force, the velocity of the centre of mass remains constant.

18. State the factors on which the position of centre of mass of a rigid body depends.

19. What is the turning effect of force called for? On what factors does it depend?

20. State the factors on which the moment of inertia of a body depends.

21. On what factors does radius of gyration of body depend?

22. Why do we prefer to use a wrench of longer arm?

23. Can a body be in equilibrium while in motion? If yes, give an example.

24. There is a stick half of which is wooden and half is of steel. (i) it is pivoted at the wooden end and a force is applied at the steel end at right angle to its length (ii) it is pivoted at the steel end and the same force is applied at the wooden end. In which case is the angular acceleration more and why?
25. If earth contracts to half of its present radius what would be the length of the day at equator?

26. An internal force can not change the state of motion of centre of mass of a body. How does the internal force of the brakes bring a vehicle to rest?

27. When does a rigid body said to be in equilibrium? State the necessary condition for a body to be in equilibrium.

28. How will you distinguish between a hard boiled egg and a raw egg by spinning it on a table top?

29. What are binary stars? Discuss their motion in respect of their centre of mass.

30. In which condition a body lying in gravitational field is in stable equilibrium?

31. Give the physical significance of moment of inertia.

**ROTATIONAL MOTION (3 MARKS)**

32. Derive the three equation of rotational motion (i) \( \omega = \omega_0 + at \)

(ii) \( \theta = \omega_0 t + \frac{1}{2} \alpha t^2 \)

(iii) \( \omega^2 = \omega_0^2 + 2\alpha\theta \)

under constant angular acceleration. Here symbols have usual meaning.

33. Obtain an expression for the work done by a torque. Hence write the expression for power.

34. Prove that the rate of change of angular momentum of a system of particles about a reference point is equal to the net torque acting on the system.

35. Derive a relation between angular momentum, moment of inertia and angular velocity of a rigid body.

36. Show that moment of a couple does not depend on the point about which moment is calculated.
37. A disc rotating about its axis with angular speed \( \omega_0 \) is placed lightly (without any linear push) on a perfectly frictionless table. The radius of the disc is \( R \). What are the linear velocities of the points A, B and C on the discs shown in figure. Will the disc roll?

![Figure](image)

38. A uniform circular disc of radius \( R \) is rolling on a horizontal surface. Determine the tangential velocity (i) at the upper most point (ii) at the centre of mass and (iii) at the point of contact.

39. Explain if the ice on the polar caps of the earth melts, how will it affect the duration of the day?

40. A solid cylinder rolls down an inclined plane. Its mass is 2 kg and radius 0.1 m. If the height of the incline plane is 4m, what is rotational K.E. when it reaches the foot of the plane?

41. Find the torque of a force \( 7i - 3j - 5k \) about the origin which acts on a particle whose position vector is \( i + j - k \).

**NUMERICALS**

42. Three masses 3 kg, 4 kg and 5 kg are located at the corners of an equilateral triangle of side 1m. Locate the centre of mass of the system.

43. Two particles mass 100 g and 300 g at a given time have velocities \( 10i - 7j - 3k \) and \( 7i - 9j + 6k \) ms\(^{-1} \) respectively. Determine velocity of COM.

44. From a uniform disc of radius \( R \), a circular disc of radius \( R/2 \) is cut out. The centre of the hole is at \( R/2 \) from the centre of original disc. Locate the centre of gravity of the resultant flat body.

45. The angular speed of a motor wheel is increased from 1200 rpm to 3120 rpm in 16 seconds, (i) What is its angular acceleration (assume
the acceleration to be uniform) (ii) How many revolutions does the wheel make during this time?

46. A metre stick is balanced on a knife edge at its centre. When two coins, each of mass 5 g are put one on top of the other at the 12.0 cm mark, the stick is found to be balanced at 45.0 cm, what is the mass of the meter stick?

47. A hoop of radius 2 m weighs 100 kg. It rolls along a horizontal floor so that its centre of mass has a speed of 20 cm/s. How much work has to be done to stop it?

48. Calculate the ratio of radii of gyration of a circular ring and a disc of the same radius with respect to the axis passing through their centres and perpendicular to their planes.

49. Two discs of moments of inertia $I_1$ and $I_2$ about their respective axes (normal to the disc and passing through the centre), and rotating with angular speed $\omega_1$ and $\omega_2$, are brought into contact face to face with their axes of rotation coincident, (i) What is the angular speed of the two-disc system? (ii) Show that the kinetic energy of the combined system is less than the sum of the initial kinetic energies of the two discs. How do you account for this loss in energy? Take $\omega_1 \neq \omega_2$.

50. In the HCl molecule, the separating between the nuclei of the two atoms is about 1.27 Å (1Å = $10^{-10}$ m). Find the approximate location of the CM of the molecule, given that the chlorine atom is about 35.5 times as massive as a hydrogen atom and nearly all the mass of an atom is concentrated in all its nucleus.

51. A child stands at the centre of turntable with his two arms out stretched. The turntable is set rotating with an angular speed of 40 rpm. How much is the angular speed of the child if he folds his hands back and thereby reduces his moment of inertia to 2/3 times the initial value? Assume that the turntable rotates without friction. (ii) Show that the child's new kinetic energy of rotation is more than the initial kinetic energy of rotation. How do you account for this increase in kinetic energy?

52. To maintain a rotor at a uniform angular speed of 200 rad s$^{-1}$, an engine needs to transmit a torque of 180 Nm. What is the power required by the engine? Assume that the engine is 100% efficient.
ROTATIONAL MOTION (5 MARKS)

53. Prove that the angular momentum of a particle is twice the product of its mass and areal velocity. How does it lead to the Kepler’s second law of planetary motion?

54. Prove the result that the velocity $V$ of translation of a rolling body (like a ring, disc, cylinder or sphere) at the bottom of an inclined plane of a height $h$ is given by $v^2 = \frac{2gh}{1 + \frac{k^2}{R^2}}$

where $K = \text{Radius of gyration of body about its symmetry axis}$, and $R$ is radius of body. The body starts from rest at the top of the plane.

55. (i) Establish the relation between torque and angular acceleration. Hence define moment of inertia.

(ii) Establish the relation between moment of inertia and torque on a rigid body.

(iii) Establish the relation between angular momentum and moment of inertia for a rigid body.

(iv) Show that angular momentum = moment of inertia x angular velocity and hence define moment of inertia.

(v) State the law of conservation of angular momentum and illustrate it with the example of planetary motion.

(vi) State and prove the principle of conservation of angular momentum.

56. State the theorem of

(i) perpendicular axis (ii) parallel axis.

Find the moment of inertia of a rod of mass $M$ and length $L$ about and axis perpendicular to it through one end. Given the moment of inertia about an axis perpendicular to rod and through COM is $\frac{1}{12} ML^2$. 

1. It will be about an axis passing through the centre of the cube and connecting the opposite corners.

3. \( \frac{1}{2} \text{MR}^2 \).

4. No. It can produce only rotatory motion.

5. Radial Component

6. P.E. is minimum.

7. No, it changes with the position of axis of rotation.

8. Sphere of small density will have large moment of inertia.

9. \( K = \frac{L^2}{2I} \Rightarrow K_B > K_A \)

10. as \( \vec{L} = \vec{r} \times \vec{mv} \) i.e magnitude \( \vec{L} \) decreases but direction remains constant.

11. zero

12. Angular momentum of planet.

13. zero.

14. No. \( \omega \propto \frac{1}{I} \).

15. due to conservation of angular momentum

16. No change in speed of system as no external force is working.
ANSWERS (2 MARKS)

18. (i) Shape of body
   (ii) mass distribution

19. Torque

Factors
   (i) Magnitude of force
   (ii) Perpendicular distance of force vector from axis of rotation.

19. (i) Mass of body
   (ii) Size and shape of body
   (iii) Mass distribution w.r.t. axis of rotation
   (iv) position and orientation of rotational axis

23. to increase torque.

23. Yes, if body has no linear and angular acceleration. Hence a body in uniform straight line motion will be in equilibrium.

24. $I_{\text{first case}} > I_{\text{Second case}}$

   $\therefore \tau = I \alpha$

   $\Rightarrow \alpha \ (\text{first case}) < \alpha \ (\text{second case})$

25. $I_1 = \frac{2}{5} MR^2 \Rightarrow I_2 = \frac{2}{5} M \left(\frac{R}{2}\right)^2 \Rightarrow I_2 = \frac{1}{4}$

   $L = I_1 \omega_1 = I_2 \omega_2$

   Or $I \left(\frac{2\pi}{T_1}\right) = \frac{1}{4} \left(\frac{2\pi}{T_2}\right)$

   Or $T_2 = \frac{T_1}{4} = \frac{24}{4} = 6 \text{ hours}$
26. In this case the force which bring the vehicle to rest is friction, and it is an external force.

27. For translation equilibrium

\[ \sum \vec{F}_{\text{ext}} = 0 \]

For rotational equilibrium

\[ \sum \vec{r}_{\text{ext}} = 0 \]

28. For same external torque, angular acceleration of raw egg will be small than that of hard boiled egg.

29. When vertical line through centre of gravity passes through the base of the body.

30. It plays the same role in rotatory motion as the mass does in translatory motion.

**ANSWER (3 MARKS)**

37. For \( A \) \( V_A = R \omega_0 \) in forward direction

For \( B = V_B = R \omega_0 \) in backward direction

For \( C \) \( V_C = \frac{R}{2} \omega_0 \) in forward direction disc will not roll.

**ANSWER (NUMERICALS)**

42. \((x, y) = (0.54 \text{ m}, 0.36 \text{ m})\)

43. Velocity of COM \( \frac{31i - 34j + 15k}{2} \text{ m/s}^{-1} \)

44. COM of resulting portion lies at \( R/6 \) from the centre of the original disc in a direction opposite to the centre of the cut out portion.

45. \( \alpha = 4\pi \text{ rad s}^{-1} \)

\( n = 576 \)
46. \( m = 66.0 \text{g} \)

47. Here \( R = 2 \text{m}, M = 100 \text{kg}, \nu_\text{cm} = 20 \text{cms}^{-1} = 0.20 \text{ms}^{-1} \).

Work required to stop the hoop + Total K.E. of the Loop

\[
= \text{Rotational K.E.} + \text{Translational K.E.} = \frac{1}{2} I \omega^2 + \frac{1}{2} M \nu_{\text{cm}}^2 \\
= \frac{1}{2} \times M R^2 \times \left(\frac{\nu_{\text{cm}}}{2}\right)^2 + \frac{1}{2} M \left(\nu_{\text{cm}}\right)^2 = M \nu_{\text{cm}}^2 = 100 \times (0.20)^2 = 4 \text{J}
\]

48. \[
\frac{K_{\text{ring}}}{R/\sqrt{2}} = \frac{\sqrt{2}}{1}
\]

49. (i) Let \( \omega \) be the angular speed of the two-disc system. Then by conservation of angular momentum.

\[
(I_1 + I_2) \omega = I_1 \omega_1 + I_2 \omega_2 \text{ or } \omega = \frac{I_1 \omega_1 + I_2 \omega_2}{I_1 + I_2}
\]

(ii) Initial K.E. of the two discs.

\[
K_1 = \frac{1}{2} I_1 \omega_1^2 + \frac{1}{2} I_2 \omega_2^2
\]

Final K.E. of the two disc system.

\[
K_2 = \frac{1}{2} (I_1 + I_2) \omega^2
\]

\[
= \frac{1}{2} (I_1 + I_2) \left(\frac{I_1 \omega_1 + I_2 \omega_2}{I_1 + I_2}\right)^2.
\]

Loss in K.E.

\[
= K_1 - K_2 = \frac{1}{2} (I_1 \omega_1^2 + I_2 \omega_2^2) - \frac{1}{2} (I_1 \omega_1^2 + I_2 \omega_2^2) = \frac{I_1 I_2}{2(I_1 + I_2)} (\omega_1 - \omega_2)^2
\]

\[
\text{a positive quantity} \quad \because \omega_1 \neq \omega_2
\]
Hence there is a loss of rotational K.E. which appears as heat.

When the two discs are brought together, work is done against friction between the two discs.

50. As shown in Fig. suppose the H nucleus is located at the origin. Then

\[ x_1 = 0, \quad x_2 = 1.27 \text{Å}, \quad m_1 = 1, \quad m_2 = 35.5 \]

The position of the CM of HCl molecule is

\[ x = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2} = \frac{1 \times 0 + 35.5 \times 1.27}{1 + 35.5} = 1.239 \text{Å} \]

Thus the CM of HCl is located on the line joining H and Cl nuclei at a distance of 1.235 Å from the H nucleus.

51. Here \( \omega_1 = 40 \text{ rpm} \), \( I_2 = \frac{2}{5} I_1 \)

By the principle of conservation of angular momentum,

\[ I_1 \omega_1 = I_2 \omega_2 \text{ or } I_1 \times 40 = \frac{2}{5} I_1 \omega_2 \text{ or } \omega_2 = 100 \text{ rpm} \]

(ii) Initial kinetic energy of rotation

\[ \frac{2}{5} I_1 \omega_1^2 = \frac{2}{5} I_1 (40)^2 = 800 I_1 \]

New kinetic energy of rotation

\[ \frac{2}{5} I_2 \omega_2^2 = \frac{1}{2} \times \frac{2}{3} I_1 (100)^2 = 2000 I_1 \]
\[
\frac{\text{New K.E.}}{\text{Initial K.E.}} = \frac{2000I_i}{800I_i} = 2.5
\]

Thus the child's new kinetic energy of rotation is 2.5 times its initial kinetic energy of rotation. This increase in kinetic energy is due to the internal energy of the child which he uses in folding his hands back from the outstretched position.

52. Here \( \omega = 200 \text{ rad s}^{-1}, \tau = 180 \text{ Nm} \)

\[
\therefore \text{Power, } P = \tau \omega = 180 \times 200 = 36,000 \text{ W} = 36 \text{ kW.}
\]
6.1 Newton’s law of Gravitation

Newton’s law of gravitation states that every body in this universe attracts every other body with a force, which is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centres. The direction of the force is along the line joining the particles.

Thus the magnitude of the gravitational force $F$ that two particles of masses $m_1$ and $m_2$ separated by a distance $r$ exert on each other is given by $F = \frac{G m_1 m_2}{r^2}$.

or $F = G \frac{m_1 m_2}{r^2}$.

Also clear that $\vec{F}_{12} = -\vec{F}_{21}$. Which is Newton’s third law of motion.

Here $G$ is constant of proportionality which is called ‘Universal gravitational constant’.

(i) The value of $G$ is $6.67 \times 10^{-11}$ N·m$^2$ kg$^{-2}$ in S.I. and $6.67 \times 10^{-8}$ dyne·cm$^2$g$^{-2}$ in C.G.S. system.

(ii) Dimensional formula $[M^{-1}L^3T^{-2}]$.

(iii) The value of $G$ does not depend upon the nature and size of the bodies.

(iv) It does not depend upon the nature of the medium between the two bodies.
6.2 Acceleration Due to Gravity.

The force of attraction exerted by the earth on a body is called gravitational pull or gravity.

The acceleration produced in the motion of a body under the effect of gravity is called acceleration due to gravity, it is denoted by $g$.

If $M =$ mass of the earth and $R =$ radius of the earth and $g$ is the acceleration due to gravity, then

\[ g = \frac{GM}{R^2} = \frac{4}{3}\pi pGR \]

(i) Its value depends upon the mass radius and density of planet and it is independent of mass, shape and density of the body placed on the surface of the planet.

(ii) Acceleration due to gravity is a vector quantity and its direction is always towards the centre of the planet.

(iii) Dimension $[g] = [LT^{-2}]$.

(iv) It's average value is taken to be 9.8 m/s$^2$ or 981 cm/sec$^2$, on the surface of the earth at mean sea level.

6.3 Variation in $g$ with Height.

Acceleration due to gravity at height $h$ from the surface of the earth

\[ g' = \frac{GM}{(R + h)^2} \]

Also

\[ g' = g \left( \frac{R}{R + h} \right)^2 \]

\[ = g \frac{R^2}{r^2} \quad [\text{As } r = R+h] \]

(i) If $h << R$  \[ g' = g \left[ 1 - \frac{2h}{R} \right] \]
(i) If \( h << R \)  
Percentage decrease \( \frac{\Delta g}{g} \times 100\% = \frac{2h}{R} \times 100\% \)

6.4 Variation in \( g \) With Depth

Acceleration due to gravity at depth \( d \) from the surface of the earth

\[
g' = \frac{4}{3} \pi pG(R - d)
\]

also

\[
g' = g \left[ 1 - \frac{d}{R} \right]
\]

(i) The value of \( g \) decreases on going below the surface of the earth.

(ii) The acceleration due to gravity at the centre of earth becomes zero.

(iii) Percentage decrease \( \frac{\Delta g}{g} \times 100\% = \frac{d}{R} \times 100\% \)

(iv) The rate of decrease of gravity outside the earth (if \( h << R \)) is double to that of inside the earth.

6.5 Gravitational Field.

The space surrounding a material body in which gravitational force of attraction can be experienced is called its gravitational field.

**Gravitational Field Intensity**: The intensity of the gravitational field of a material body at any point in its field is defined as the force experienced by a unit mass (test mass) placed at that point. If a test mass \( m \) at a point in a gravitational field experiences a force \( \vec{F} \) then \( \vec{I} = \frac{\vec{F}}{m} \).

6.16 Gravitational Potential.

At a point in a gravitational field potential \( V \) is defined as negative of work done per unit mass in shifting a test mass from some reference point (usually at infinity) to the given point.
Negative sign indicates that the direction of intensity is in the direction where the potential decreases.

Gravitational potential \( V = -\frac{GM}{r} \)

6.7 Gravitational Potential Energy

The gravitational potential energy of a body at a point is defined as the amount of work done in bringing the body from infinity to that point against the gravitational force.

\[ W = -\frac{GMm}{r} \]

This work done is stored inside the body as its gravitational potential energy

\[ U = -\frac{GMm}{r} \]

If \( r = \infty \) then it becomes zero (maximum)

6.18 Escape Velocity.

The minimum velocity with which a body must be projected up so as to enable it to just overcome the gravitational pull, is known as escape velocity.

If \( v_e \) is the required escape velocity, then

\[ v_e = \sqrt{\frac{2GM}{R}} \Rightarrow v_e = \sqrt{2gR} \]

(i) Escape velocity is independent of the mass and direction of projection of the body.

(ii) For the earth

\[ v_e = 11.2 \text{ km/sec} \]

(iii) A planet will have atmosphere if the velocity of molecule in its atmosphere is lesser than escape velocity. This is why earth has atmosphere while moon has no atmosphere
6.9 Kepler’s Laws of Planetary Motion

(1) The law of Orbits: Every planet moves around the sun in an elliptical orbit with sun at one of the foci.

(2) The law of Area: The line joining the sun to the planet sweeps out equal areas in equal interval of time. i.e. areal velocity is constant. According to this law planet will move slowly when it is farthest from sun and more rapidly when it is nearest to sun. It is similar to law of conservation of angular momentum.

\[ \text{Areal velocity} \quad \frac{dA}{dt} = \frac{L}{2m} \]

(3) The law of periods: The square of period of revolution \((T)\) of any planet around sun is directly proportional to the cube of the semi-major axis of the orbit.

\[ T^2 \propto a^3 \text{ or } T^2 \propto \left(\frac{r_1 + r_2}{2}\right)^3 \]

where

- \(a = \) semi-major axis
- \(r_1 = \) Shortest distance of planet from sun (perigee).
- \(r_2 = \) Largest distance of planet from sun (apogee).

- Kepler’s laws are valid for satellites also.

6.10 Orbital Velocity of Satellite.

\[ v = \sqrt{\frac{GM}{r}} \quad [r = R + h] \]

(i) Orbital velocity is independent of the mass of the orbiting body.

(ii) Orbital velocity depends on the mass of planet and radius of orbit.

(iii) Orbital velocity of the satellite when it revolves very close to the surface of the planet
\[ v = \sqrt{\frac{GM}{r}} = \sqrt{gR} \approx 8 \text{ km/sec} \]

6.11 Time Period of Satellite

\[ T = 2\Pi \sqrt[3]{\frac{(R+h)^3}{g R^2}} = 2\Pi \sqrt[3]{\frac{R}{g} \left(1+\frac{h}{R}\right)^{3/2}} \quad [\text{As } r = R + h] \]

(i) Time period is independent of the mass of orbiting body

(ii) \( T^2 \propto r^3 \) (Kepler’s third law)

(iii) Time period of nearby satellite, \( T = 2\theta \sqrt[3]{\frac{R}{g}} \)

For earth \( T = 84.6 \text{ minute} \approx 1.4 \text{ hr.} \)

6.12 Height of Satellite

\[ h = \left(\frac{T^2 g R^2}{4\pi^2}\right)^{1/3} - R \]

6.13 Geostationary Satellite.

The satellite which appears stationary relative to earth is called geostationary or geosynchronous satellite, communication satellite.

A geostationary satellite always stays over the same place above the earth. The orbit of a geostationary satellite is known as the parking orbit.

(i) It should revolve in an orbit concentric and coplanar with the equatorial plane.

(ii) Its sense of rotation should be same as that of earth.

(iii) Its period of revolution around the earth should be same as that of earth.

(iv) Height of geostationary satellite from the surface of earth \( h = 6R = 36000 \text{ km} \)
(v) Orbital velocity \( v = 3.08 \) km/sec

(vi) Angular momentum of satellite depend on both the mass of orbiting and planet as well as the radius of orbit.

6.14 Energy of Satellite

(1) Potential energy : 
\[ U = mV = \frac{-GmM}{r} = \frac{-L^2}{mr^2} \]

(2) Kinetic energy : 
\[ K = \frac{1}{2} m v^2 = \frac{GMm}{2r} = \frac{l^2}{2 mr^2} \]

(3) Total energy : 
\[ E = U + K = \frac{-GMm}{r} + \frac{GMm}{2r} = \frac{-GMm}{2r} = -\frac{L^2}{2mr^2} \]

(4) Energy graph for a satellite

(5) Binding Energy : The energy required to remove the satellite its orbit to infinity is called Binding Energy of the system, i.e.,
\[ \text{Binding Energy (B.E.)} = -E = \frac{GMm}{2r} \]

6.15 Weightlessness

The state of weightlessness (zero weight) can be observed in the following situations.

(1) When objects fall freely under gravity

(2) When a satellite revolves in its orbit around the earth

(3) When bodies are at null points in outer space. The zero gravity region is called null point.
UNIT VI GRAVITATION

VERY SHORT ANSWER TYPE QUESTIONS (1 MARK)

Q1. The mass of moon is nearly 10% of the mass of the earth. What will be the gravitational force of the earth on the moon, in comparison to the gravitational force of the moon on the earth?

Q2. Why does one feel giddy while moving on a merry go round?

Q3. Name two factors which determine whether a planet would have atmosphere or not.

Q4. The force of gravity due to earth on a body is proportional to its mass, then why does a heavy body not fall faster than a lighter body?

Q5. The force of attraction due to a hollow spherical shell of uniform density on a point mass situated inside is zero, so can a body be shielded from gravitational influence?

Q6. The gravitational force between two bodies in 1 N if the distance between them is doubled, what will be the force between them?

Q7. A body of mass 5 kg is taken to the centre of the earth. What will be its (i) mass (ii) weight there.

Q8. Why is gravitational potential energy negative?

Q9. A satellite revolves close to the surface of a planet. How is its orbital velocity related with escape velocity of that planet.

Q10. Does the escape velocity of a body from the earth depend on (i) mass of the body (ii) direction of projection

Q11. Identify the position of sun in the following diagram if the linear speed of the planet is greater at C than at D.
Q12. A satellite does not require any fuel to orbit the earth. Why?

Q13. A satellite of small mass burns during its descent and not during ascent. Why?

Q14. Is it possible to place an artificial satellite in an orbit so that it is always visible over New Delhi?

Q15. If the density of a planet is doubled without any change in its radius, how does 'g' change on the planet?

Q16. Why is the weight of a body at the poles more than the weight at the equator? Explain.

Q17. Why an astronaut in an orbiting space craft is not in zero gravity although he is in weightlessness?

Q18. Write one important use of (i) geostationary satellite (ii) polar satellite.

Q19. A binary star system consists of two stars A and B which have time periods $T_A$ and $T_B$, radius $R_A$ and $R_B$ and masses $m_A$ and $m_B$ which of the three quantities are same for the stars. Justify.

Q20. The time period of the satellite of the earth is 5 hr. If the separation between earth and satellite is increased to 4 times the previous value, then what will be the new time period of satellite.

Q21. Why does the earth impart the same acceleration to every bodies?

Q22. If suddenly the gravitational force of attraction between earth and satellite become zero, what would happen to the satellite?

**SHORT ANSWER TYPE QUESTIONS (2 MARKS)**

Q23. If the radius of the earth were to decrease by 1%, keeping its mass same, how will the acceleration due to gravity change?

Q24. Which of the following symptoms is likely to afflict an astronaut in space (a) swollen feet, (b) swollen face, (c) headache, (d) orientation problem.

Q25. A satellite is moving round the earth with velocity $v_0$ what should be the minimum percentage increase in its velocity so that the satellite escapes.
Q26. The radii of two planets are R and 2R respectively and their densities $\rho$ and $\rho/2$ respectively. What is the ratio of acceleration due to gravity at their surfaces?

Q27. If earth has a mass 9 times and radius 4 times than that of a planet ‘P’. Calculate the escape velocity at the planet ‘P’ if its value on earth is 11.2 kms$^{-1}$

Q28. At what height from the surface of the earth will the value of ‘g’ be reduced by 36% of its value at the surface of earth.

Q29. At what depth is the value of ‘g’ same as at a height of 40 km from the surface of earth.

Q30. The mean orbital radius of the earth around the sun is $1.5 \times 10^8$ km. Calculate mass of the sun if $G = 6.67 \times 10^{-11}$ N m$^2$/kg$^{-2}$?

Q31. Draw graphs showing the variation of acceleration due to gravity with (i) height above earth is surface (ii) depth below the earth’s surface.

Q32. A rocket is fired from the earth towards the sun. At what point on its path is the gravitational force on the rocket zero? Mass of sun $= 2 \times 10^{30}$ kg, mass of the earth $= 6 \times 10^{24}$ kg. Neglect the effect of other planets etc. Orbital radius $= 1.5 \times 10^{11}$ m.

Q33. A Saturn year is 29.5 times the earth year. How far is the Saturn from the sun if the earth is $1.50 \times 10^8$ km away from the sun?

Q34. A body weighs 63 N on the surface of the earth. What is the gravitational force on it due to the earth at a height equal to half the radius of the earth?

Q35. Why the space rockets are generally launched west to East?

Q36. Explain why a tennis ball bounces higher on hills than in plane?

Q37. The gravitational force on the earth due to the sun is greater than moon. However tidal effect due to the moon’s pull is greater than the tidal effect due to sun. Why?

Q38. The mass of moon is $\frac{M}{81}$ (where M is mass of earth). Find the distance of the point where the gravitational field due to earth and moon cancel
each other. Given distance of moon from earth is 60 R, where R is radius of earth.

Q39 The figure shows elliptical orbit of a planet m about the sun S. The shaded area of SCD is twice the shaded area SAB. If t₁ is the time for the planet to move from D to C and t₂, is time to move from A to B, what is the relation between t₁ and t₂?

Q40. Calculate the energy required to move a body of mass m from an orbit of radius 2R to 3R.

Q41. A man can jump 1.5 m high on earth. Calculate the height he may be able to jump on a planet whose density is one quarter that of the earth and whose radius is one third of the earth.

SHORT ANSWER TYPE QUESTIONS (3 MARKS)

Q42. Define gravitational potential at a point in the gravitational field. Obtain a relation for it. What is the position at which it is (i) maximum (ii) minimum.

Q43. Find the potential energy of a system of four particles, each of mass m, placed at the vertices of a square of side. Also obtain the potential at the centre of the square.

Q44. Three mass points each of mass m are placed at the vertices of an equilateral triangle of side l. What is the gravitational field and potential at the centroid of the triangle due to the three masses.

Q45. Briefly explain the principle of launching an artificial satellite. Explain the use of multistage rockets in launching a satellite.

Q46. In a two stage launch of a satellite, the first stage brings the satellite to a height of 150 km and the 2nd stage gives it the necessary critical
speed to put it in a circular orbit. Which stage requires more expenditure of fuel? Given mass of earth = $6.0 \times 10^{24}$ kg, radius of earth = 6400 km

Q47. The escape velocity of a projectile on earth's surface is 11.2 kms$^{-1}$ A body is projected out with thrice this speed. What is the speed of the body far away from the earth? Ignore the presence of the sun and other planets.

Q48. A satellite orbits the earth at a height ‘$R$’ from the surface. How much energy must be expended to rocket the satellite out of earth’s gravitational influence?

Q49. Define gravitational potential. Give its SI units.

Q50. What do you mean by gravitational potential energy of a body? Obtain an expression for it for a body of mass $m$ lying at distance $r$ from the centre of the earth.

Q51. State and explain Kepler’s laws of planetary motion. Name the physical quantities which remain constant during the planetary motion.

LONG ANSWER TYPE QUESTIONS (5 MARKS)

Q52. What is acceleration due to gravity? Obtain relations to show how the value of ‘$g$’ changes with (i) attitude (ii) depth

Q53. Define escape velocity obtain an expression for escape velocity of a body from the surface of earth? Does the escape velocity depend on (i) location from where it is projected (ii) the height of the location from where the body is launched.

Q54. State Kepler’s three laws of planetary motion. Prove the second and third law.

Q55. Derive expression for the orbital velocity of a satellite and its time period. What is a geostationary satellite. Obtain the expression for the height of the geostationary satellite.

Q56. State and derive Kepler’s law of periods (or harmonic law) for circular orbits.
Q57. A black hole is a body from whose surface nothing may ever escape. What is the condition for a uniform spherical mass M to be a black hole? What should be the radius of such a black hole if its mass is the same as that of the earth?

**NUMERICALS**

Q58. The mass of planet Jupiter is $1.9 \times 10^{27}$ kg and that of the sun is $1.99 \times 10^{30}$ kg. The mean distance of Jupiter from the Sun is $7.8 \times 10^{11}$ m. Calculate gravitational force which sun exerts on Jupiter, and the speed of Jupiter.

Q59. A mass ‘M’ is broken into two parts of masses $m_1$, and $m_2$. How are $m_1$, and $m_2$ related so that force of gravitational attraction between the two parts is maximum.

Q60. If the radius of earth shrinks by 2%, mass remaining constant. How would the value of acceleration due to gravity change?

Q61. Find the value of $g$ at a height of 400 km above the surface of the earth. Given radius of the earth, $R = 6400$ km and value of $g$ at the surface of the earth = $9.8 \text{ ms}^{-2}$. [Ans. $8.575 \text{ ms}^{-2}$]

Q62. How far away from the surface of earth does the acceleration due to gravity become 4% of its value on the surface of earth? Radius of earth = 6400 km. [Ans. 25,600 km]

Q63. The gravitational field intensity at a point 10,000 km from the centre of the earth is 4.8 N kg$^{-1}$. Calculate gravitational potential at that point.

Q64. A geostationary satellite orbits the earth at a height of nearly 36000 km. What is the potential due to earth's gravity at the site of this satellite (take the potential energy at $\infty$ to be zero). Mass of earth is $6 \times 10^{24}$ kg, radius of earth is 6400 km.

Q65. Jupiter has a mass 318 times that of the earth, and its radius is 11.2 times the earth's radius. Estimate the escape velocity of a body from Jupiter's surface, given that the escape velocity from the earth's surface is 11.2 km s$^{-1}$. 

[Class XI : Physics] 150
Q66. The distance of Neptune and Saturn from the sun is nearly $10^{13}$m and $10^{12}$m respectively. Assuming that they move in circular orbits, then what will be the ratio of their periods.

Q67. Let the speed of the planet at perihelion P in fig be $v_p$, and Sun planet distance SP be $r_p$. Relate $(r_A, v_A)$ to the corresponding quantities at the aphelion $(r_A', v_A')$. Will the planet take equal times to traverse BAC and CPB?

UNIT VI GRAVITATION

ANSWER FOR VERY SHORT QUESTIONS (1 MARK)

1. Both forces will be equal in magnitude as gravitational force is a mutual force between the two bodies.

2. When moving in a merry go round, our weight appears to decrease when we move down and increases when we move up, this change in weight makes us feel giddy.

3. (i) Value of acceleration due to gravity

   (ii) surface temperature of planet.

4. $\therefore F = \frac{G M m}{R^2}$ $F \propto m$ but $g = \frac{G m}{R^2}$ and does not depend on ‘m’ hence they bodies fall with same ‘g’.

5. No, the gravitational force is independent of intervening medium.
6. \( F = 1 \) \( F' = \frac{F}{4} \)

7. Mass does not change.

8. Because it arises due to attractive force of gravitation.

9. \( v_e = \sqrt{2} \) \( v_o \therefore v_e = \sqrt{\frac{2GM}{R}} \) \( v_o = \sqrt{\frac{GM}{R}} \) when \( r = R \)

10. No, \( v_e = \sqrt{\frac{2GM}{R}} \)

11. Sun should be at B as speed of planet is greater when it is closer to sun.

12. The gravitational force between satellite and earth provides the necessary centripetal force for the satellite to orbit the earth.

13. The speed of satellite during descent is much larger than during ascent, and so heat produced is large.

14. No, A satellite will be always visible only if it revolves in the equatorial plane, but New Delhi does not lie in the region of equatorial plane.

15. ‘g’ gets doubled as \( g \propto \rho \) (density)

16. As \( g = \frac{GM}{R^2} \) and the value of \( R \) at the poles is less than that the equator, so \( g \) at poles is greater than \( g \) at the equator. Now, \( g_p > g_e \), hence \( mg_p > g_p \) i.e., the weight of a body at the poles is more than the weight at the equator.

17. The astronaut is in the gravitational field of the earth and experiences gravity. However, the gravity is used in providing necessary centripetal force, so is in a state of free fall towards the earth.

18. Geostationary satellite are used for tele communication and polar satellite for remote sensing.

19. Angular velocity of binary stars are same is \( \omega_A = \omega_B \),

\[
\frac{2\pi}{T_A} = \frac{2\pi}{T_B} \Rightarrow T_A = T_B
\]
20. \( \frac{T_2^2}{T_1^2} = \left(\frac{R_2}{R_1}\right)^3 \Rightarrow T_2^2 = 64 \times 25 \Rightarrow T_2 = 40 \text{ hr} \)

21. The force of gravitation exerted by the earth on a body of mass \( m \) is

\[ F = \frac{G M m}{R^2} = mg \]

Acceleration imparted to the body, \( g = \frac{G m}{R^2} \)

Clearly, \( g \) does not depend on \( m \). Hence the earth imparts same acceleration to all bodies.

22. The satellite will move tangentially to the original orbit with a velocity with which it was revolving.

**SHORT ANSWERS (2 MARKS)**

23. \( g = \frac{G m}{R^2} \). If \( R \) decreases by 1% it becomes \( \frac{99}{100} R \)

\[ g' = \frac{G M}{(0.99 R)} = 1.02 \frac{G m}{R^2} = (1 + 0.02) \frac{G m}{R^2} \]

\( \therefore \) \( g' \) increases by 0.02 \( \frac{G m}{R^2} \), therefore increases by 2%.

24. (b), (c) and (d) are affected in space.

25. The maximum orbital velocity of a satellite orbiting near its surface is

\[ v_o = \sqrt{gR} = \frac{v_e}{\sqrt{2}} \]

For the satellite to escape gravitational pull the velocity must become \( v_e \)

But \( v_e = \sqrt{2} v_o = 1.414 \ v_o = (1 + 0.414) \ v_o \)

This means that it has to increases 0.414 in 1 or 41.4%.
The minimum increment is required, as the velocity of satellite is maximum when it is near the earth.

26. Here

\[ g = \frac{GM}{R^2} = \frac{GM}{R^2} \cdot \frac{4}{3} \pi R^3 \rho \]

or \( g \propto R \rho \)

\[ \therefore \frac{g_1}{g_2} = \frac{R \rho}{2R \frac{\rho}{2}} = 1:1. \]

27. \( v = \sqrt{\frac{2GM}{R}} \)

\[ \therefore v_p = \sqrt{\frac{2GM_p}{R_p}} \]

\[ M_p = \frac{M}{9}, R_p = \frac{R}{4} \]

\[ \therefore v_p = \sqrt{\frac{2GM}{9R}} = \frac{2}{3} \sqrt{\frac{2GM}{R}} = \frac{2}{3} \times \frac{11.2}{3} = \frac{7.47}{3} \text{ km/sec} \]

28. \( g' = 64\% \) of \( g = \frac{64}{100} g \)

\[ g' = g \left( \frac{R^2}{(R+h)^2} \right) = \frac{64}{100} g \]

\[ \therefore \frac{R}{R+h} = \frac{8}{10} \]

\[ h = \frac{R}{4} = 1600 \text{km} \]

29. \( g_d = g_h \)

\[ g \left( 1 - \frac{d}{R} \right) = g \left( 1 - \frac{2h}{R} \right) \]

\[ d = 2h = 2 \times 40 = 80 \text{ km} \]
30. \( R = 1.5 \times 10^8 \text{ km} = 1.5 \times 10^{11} \text{ m} \)

\( T = 365 \text{ days} = 365 \times 24 \times 3600 \text{ s} \)

Centripetal force = gravitational force

\[
\frac{Mv^2}{R} = \frac{GmM}{R^2} = m \left( \frac{2\pi R}{T} \right)^2 = \frac{Gm}{R^2}
\]

\[
M_s = \frac{4\pi^2 R^3}{GT^2} = \frac{4 \times 9.87 \times (1.5 \times 10^{11})^3}{6.64 \times 10^{-11} \times (365 \times 24 \times 3600)^2}
\]

\( M_s = 2.01 \times 10^{30} \text{ g} \)

31. \( g \propto \frac{1}{r^2} \) for \( r > 0 \) above surface of earth

\[
g \propto (R - d) \text{ for } r < 0 \text{ below surface of earth}
\]

g is max for \( r = 0 \) on surface.

32. Given \( M_s = 2 \times 10^{30} \text{ kg} \),

\( M_e = 6 \times 10^{24} \text{ kg}, \ r = 1.5 \times 10^{11} \text{ m} \)

Let \( m \) be the mass of the rocket. Let at distance \( x \) from the earth, the gravitational force on the rocket be zero.

Then at this distance, Gravitational pull of the earth on the rocket = Gravitational pull of the sun on the rocket
i.e., \( \frac{GM_e}{x^2} \cdot m = \frac{GM_n}{(r-x)^2} \) or \( \frac{(r-x)^2}{x^2} = \frac{M_n}{M_e} \)

\[
\frac{R-x}{x} = \sqrt{\frac{M_n}{M_e}} = \sqrt{\frac{2 \times 10^{30}}{6 \times 10^{24}}} = \frac{10}{\sqrt{3}} \approx 577.35
\]

or \( r - x = 577.35x \)

or \( 578.35 \times x = r = 1.5 \times 10^{11} \) or \( x = \frac{1.5 \times 10^{11}}{578.35} = 2.59 \times 10^8 \) m.

33. According to Kepler’s law of periods, \( \left( \frac{T_s}{T_E} \right)^2 = \left( \frac{r_s}{r_E} \right)^3 \)

But \( \frac{T_s}{T_E} = 29.5 \) and \( r_E = 1.5 \times 10^8 \) km.

\( \therefore (29.5)^2 = \left( \frac{r_s}{1.5 \times 10^8} \right)^3 \)

or \( r_s = 1.5 \times 10^8 \times (29.5)^{2/3} = 14.32 \times 10^8 \) km.

34. Here \( mg = 63 \) N, \( h = R/2 \)

\[
\begin{align*}
\text{As} \quad \frac{g_h}{g} &= \left( \frac{R}{R+h} \right)^2 = \left( \frac{R}{R + \frac{R}{2}} \right)^2 = \left( \frac{2}{3} \right)^2 = \frac{4}{9}.
\end{align*}
\]

\( g_h = \frac{4}{9}g \quad \therefore \quad mg_h = \frac{4}{9}mg = \frac{4}{9} \times 63 = 28 \) N.

35. Since the earth revolves from west to east, so when the rocket is launched from west to east the relative velocity of the rocket increases which helps it to rise without much consumption of fuel.

36. The value of ‘g’ on hills is less than at the plane, so the weight of tennis ball on the hills is lesser force than at planes that is why the earth attract
the ball on hills with lesser force than at planes. Hence the ball bounces higher.

37. The tidal effect depends inversely on the cube of the distance, while gravitational force depends on the square of the distance.

38. \[ \frac{GM}{(60R - x)^2} = \frac{GM}{x^2} \]

\[ 81 x^2 = (60R - x)^2 \]

\[ 9x = 60 R - x \]

\[ x = 6 R \]

39. According to Kepler’s II\textsuperscript{nd} law area velocity for the planet is constant

\[ \frac{2A_1}{t_1} \]

\[ \frac{A_2}{t_2} = 2A_2 \]

\[ \frac{2A_1}{t_1} = \frac{A_2}{t_2} \]

\[ t_1 = 2t_2 \]

40. Gravitational P.E of mass \( m \) in orbit of radius \( R \) \[ U = -\frac{GMm}{R} \]

\[ U_i = -\frac{GMm}{2R} \]
\[ U_f = -\frac{GMm}{3R} \]

\[ \Delta U = U_f - U_i = GMm \left(\frac{1}{2} - \frac{1}{3}\right) = \frac{GMm}{6R} \]

41. \( g = \frac{4}{3} \pi GR \rho \)

\[ g' = \frac{4}{3} \pi GR' \rho' \]

The gain in P.E at the highest point will be same in both cases. Hence \( mg'h' = mgh \)

\[ g' = \frac{mgh}{mg} = \frac{m \times \frac{4}{3} \pi GR \rho h}{m \times \frac{4}{3} \pi GR' \rho'} = \frac{R \rho h}{R' \rho'} = \frac{3R \times 4 \rho \times 1.5}{R' \times \rho'} = 18 \ m \]

**ANSWERS FOR 3 MARKS QUESTIONS**

44. \[ E_1 = \frac{GM}{(OA)^2} \]

\[ E_2 = \frac{GM}{(OB)^2} \]

\[ E_3 = \frac{GM}{(OC)^2} \]
From \( \Delta ODB \) \( \cos 30^\circ = \frac{BD}{OB} = \frac{\ell/2}{OB} \)

\[ OB = \frac{\ell/2}{\cos 30^\circ} = \frac{BD}{OB} = \frac{\ell/2}{\sqrt{3}} = \ell \sqrt{3} \]

Gravitational field at O due to m at A, B and C is say \( \vec{E}_1, \vec{E}_2 \) & \( \vec{E}_3 \)

\[ E = \sqrt{E_1^2 + E_2^2 + 2E_2E_3 \cos 120^\circ} \]

\[ = \sqrt{\left(\frac{GM3}{l^2}\right)^2 + \left(\frac{3Gm}{l}\right)^2 + 2\left(\frac{3GM}{l}\right)\left(-\frac{1}{2}\right)} \]

\[ = \frac{3GM}{l} \text{ along OD} \]

\( \vec{E} \) is equal and opposite to \( \vec{E}_1 \)

\( \therefore \text{ net gravitational field = zero} \)

As gravitational potential is scalar

\[ V = V_1 + V_2 + V_3 \]

\[ = \frac{GM}{OA} - \frac{GM}{OB} - \frac{GM}{OC} \]

\[ V = -\frac{3GM}{l\sqrt{3}} = -3\sqrt{3}\frac{Gm}{l} \]

46. Work done on satellite in first stage = \( W_1 = PE \) at 150 km – PE at the surface

\[ W_1 = \frac{GMm}{R+h} \left(-\frac{GMm}{R}\right) \]

\[ = \frac{GMm}{R(R+h)} \]
Work done on satellite in 2\textsuperscript{nd} stage = W\textsubscript{2} = energy required to give orbital velocity \(v_0\)

\[
\frac{1}{2} mv_0^2 = \frac{1}{2} \left( \frac{GM}{R + h} \right)
\]

\[
\frac{W_2}{R} = \frac{2 \times 150}{6400} = \frac{3}{64} \text{< 1}
\]

\(W_2 > W_1\) so second stage requires more energy

47. \(v_e = 11.2 \text{ kms}^{-1}\), velocity of projection = \(v = 3v_e\) Let \(m\) be the mass of projectile and \(v_0\) the velocity after it escapes gravitational pull.

By law of conservation of energy

\[
\frac{1}{2}mv_0^2 = \frac{1}{2}mv^2 - \frac{1}{2}mv_e^2
\]

\[
v_0 = \sqrt{v^2 - v_e^2} = \sqrt{9v_e^2 - v_e^2} = \sqrt{8v_e^2}
\]

\[
= 22.4\sqrt{2}
\]

\(= 31.68 \text{ km s}^{-1}\)

48. The energy required to pull the satellite from earth influence should be equal to the total energy with which it is revolving around the earth.

The K.E. of satellite = \(\frac{1}{2} mv^2 - \frac{1}{2} m \frac{GM}{R + h}\) \(v = \sqrt{\frac{GM}{R + h}}\)

The P.E of satellite = \(-\frac{GMm}{R + h}\)

\[\because \text{T.E.} = \frac{1}{2} \frac{mGM}{(R + h)} - \frac{GMm}{(R + h)} = \frac{1}{2} \frac{GMm}{(R + h)}\]

\[\therefore \text{Energy required will be} \left( + \frac{1}{2} \frac{GMm}{(R + h)} \right)\]
ANSWERS FOR NUMERICALS

58. \[ F = \frac{GMm}{r^2} \]

\[ = \frac{6.67 \times 10^{-11} \times 1.99 \times 10^{36} \times 1.9 \times 10^7}{(7.8 \times 10^{11})^2} \]

\[ F = 4.1 \times 10^{23} \text{ N} \]

\[ \vdash F = \frac{mv^2}{r} \Rightarrow v = \sqrt{\frac{Fr}{m}} = \sqrt{\frac{GMm}{r^2} \times \frac{r}{m}} \]

\[ v = \sqrt{\frac{GM}{r}} = \sqrt{\frac{6.67 \times 10^{-11} \times 1.99 \times 10^{36}}{7.8 \times 10^{11}}} \]

\[ v = 1.3 \times 10^4 \text{ m s}^{-1} \]

59. Let \( m_1 = m \) then \( m_2 = M - m \)

Force between them when they are separated by distance \( r \)

\[ F = \frac{Gm(M - m)}{r^2} = \frac{G}{r^2} (Mm - m^2) \]

For \( F \) to be maximum, differentiate \( F \) w.r.t \( m \) and equate to zero

\[ \frac{dF}{dm} = \frac{G}{r^2} (M - 2m) = 0 \]

\[ M = 2m; \quad m = \frac{M}{2} \]

\[ \vdash m_1 = m_2 = \frac{M}{2} \]

60. increased by 4%

61. \[ \frac{4}{100^9} g = g \left( \frac{R}{R + h} \right)^2 \]
\[ \frac{2}{10} = \frac{R}{R + h} \]

\[ \therefore h = 4R = 4 \times 6400 = 25,600 \text{ km}. \]

62. Gravitational intensity = \( I = \frac{GM}{R^2} \)

Gravitational potential \( V = -\frac{GM}{R} \)

\[ \therefore \frac{V}{E} = -R \]

or, \( V = -E \times R \)

or \( V = -4.8 \times 10^7 \text{ J} \text{ kg}^{-1} \)

63. \( U = \text{Potential at height } h = -\frac{GM}{R + h} \)

\[ U = \frac{6.67 \times 10^{-11} \times 6 \times 10^{24}}{6.4 \times 10^6 + 36 \times 10^6} = -9.44 \times 10^6 \text{ J/kg} \]

64. Escape velocity from the earth's surface is \( v_e = \sqrt{\frac{2GM}{R}} = 11.2 \text{ kms}^{-1} \)

Escape velocity from Jupiter's surface will be

\[ v_e' = \sqrt{\frac{2GM'}{R'}} \]

But \( M' = 318 M \), \( R' = 11.2 R \)

\[ \therefore v_e' = \sqrt{\frac{2G(318 M)}{11.2}} = \sqrt{\frac{2GM \times 318}{11.2}} \]

\[ = v_e' \times \sqrt{\frac{318}{11.2}} = 11.2 \times \sqrt{\frac{318}{11.2}} = 59.7 \text{ kms}^{-1} \]
65. By Kepler’s IIIrd law

\[
\left( \frac{T_n}{T_s} \right)^2 = \left( \frac{R_n}{R_s} \right)^3
\]

\[
\frac{T_n}{T_s} = \left( \frac{R_n}{R_s} \right)^{3/2} = \left( \frac{10^{13}}{10^{12}} \right)^{3/2} = 10^{3/2}
\]

\[= 10 \sqrt{10} = 10 \times 3.16 = 31.6\]

∴ \[T_n : T_s = 36.6 : 1\]

66. The magnitude of angular momentum at P is \(L_p = m_p r_p v_p\)

Similarly magnitude of angular momentum at A is \(L_A = m_A r_A v_A\)

From conservation of angular momentum

\[m_p r_p v_p = m_A r_A v_A\]

\[\frac{v_p}{v_A} = \frac{r_A}{r_p}\]

∴ \(r_A > r_p\), \(\therefore v_p > v_A\)

area bound by SB & SC(SBAC > SBPC)

∴ By 2nd law equal areas are swept in equal intervals of time. Time taken to transverse BAC > time taken to traverse CPB
7.1 Interatomic Forces

The forces between the atoms due to electrostatic interaction between the charges of the atoms are called interatomic forces.

(1) When two atoms are brought close to each other to a distance of the order of $10^{-10}$ m, attractive interatomic force is produced between two atoms.

(2) This attractive force increases continuously with decrease in $r$ and becomes maximum for one value of $r$ called critical distance, represented by $x$ (as shown in the figure).

(3) When the distance between the two atoms becomes $r_0$, the interatomic force will be zero. This distance $r_0$ is called normal or equilibrium distance.

(4) When the distance between the two atoms further decreased, the interatomic force becomes repulsive in nature and increases very rapidly.

(5) The potential energy $U$ is related with the interatomic force $F$ by the following relation.

$$F = -\frac{dU}{dr}$$
When the distance between the two atoms becomes $r_0$, the potential energy of the system of two atoms becomes minimum (i.e. attains maximum negative value hence the two atoms at separation $r_0$ will be in a state of equilibrium.

7.2 Intermolecular Forces

The forces between the molecules due to electrostatic interaction between the charges of the molecules are called intermolecular forces. These forces are also called Vander Waal forces and are quite weak as compared to inter-atomic forces.

7.3 Solids.

A solid is that state of matter in which its constituent atoms or molecules are held strongly at the position of minimum potential energy and it has a definite shape and volume.

7.4 Elastic Property of Matter

(1) Elasticity: The property of matter by virtue of which a body tends to regain its original shape and size after the removal of deforming force is called elasticity.

(2) Plasticity: The property of matter by virtue of which it does not regain its original shape and size after the removal of deforming force is called plasticity.

(3) Perfectly elastic body: If on the removal of deforming forces the body regain its original configuration completely it is said to be perfectly elastic.

A quartz fibre and phosphor is the nearest approach to the perfectly elastic body.

(4) Perfectly plastic body: If the body does not have any tendency to recover its original configuration on the removal of deforming force, it is said to be perfectly plastic.

Paraffin wax, wet clay are the nearest approach to the perfectly plastic body. Practically there is no material which is either perfectly elastic or perfectly plastic.

(5) Reason of elasticity: On applying the deforming forces, restoring forces are developed. When the deforming force is removed, these restoring forces bring the molecules of the solid to their respective equilibrium position ($r = r_0$) and hence the body regains its original form.
(6) **Elastic limit**: The maximum deforming force upto which a body retains its property of elasticity is called elastic limit of the material of body.

Elastic limit is the property of a body whereas elasticity is the property of material of the body.

(7) **Elastic fatigue**: The temporary loss of elastic properties because of the action of repeated alternating deforming force is called elastic fatigue.

It is due to this reason:

(i) Bridges are declared unsafe after a long time of their use.

(ii) Spring balances show wrong readings after they have been used for a long time.

(iii) We are able to break the wire by repeated bending.

(8) **Elastic after effect**: The time delay in which the substance regains its original condition after the removal of deforming force is called elastic after effect. It is negligible for perfectly elastic substance, like quartz, phosphor bronze and large for glass fibre.

7.5 **Stress**

The internal restoring force acting per unit area of cross section of the deformed body is called stress.

\[
\text{Stress} = \frac{\text{Force}}{\text{Area}} = \frac{F}{A}
\]

Unit : N/m² (S.I.), dyne/cm² (C.G.S.)

Stress developed in a body depends upon how the external forces are applied over it.

On this basis there are two types of stresses: Normal and Shear or tangential stress

(1) **Normal stress**: Here the force is applied normal to the surface.

It is again of two types: Longitudinal and Bulk or volume stress

(i) **Longitudinal stress**
(a) Deforming force is applied parallel to the length and causes increase in length.

(b) Area taken for calculation of stress is area of cross section.

(c) Longitudinal stress produced due to increase in length of a body under a deforming force is called tensile stress.

(d) Longitudinal stress produced due to decrease in length of a body under a deforming force is called compressional stress.

(ii) **Bulk or Volume stress**

(a) It occurs in solids, liquids or gases.

(b) Deforming force is applied normal to surface at all points.

(c) It is equal to change in pressure because change in pressure is responsible for change in volume.

(2) **Shear or tangential stress**: It comes in picture when successive layers of solid move on each other i.e. when there is a relative displacement between various layers of solid.

(i) Here deforming force is applied tangential to one of the faces.

(ii) Area for calculation is the area of the face on which force is applied.

(iii) It produces change in shape, volume remaining the same.

### 7.6 Strain.

The ratio of change in configuration to the original configuration is called strain. It has no dimensions and units. Strain are of three types:

(1) **Linear strain**: Linear strain

\[
\text{Linear strain} = \frac{\text{Change in length}}{\text{Original length}} = \frac{\ell}{L}
\]
Linear strain in the direction of deforming force is called longitudinal strain and in a direction perpendicular to force is called lateral strain.

(2) **Volumetric strain**: Volumetric strain = \[
\frac{\text{Change in volume}(\Delta v)}{\text{Original volume} (v)}
\]

(3) **Shearing strain**: It is defined as angle in radians through which a plane perpendicular to the fixed surface of the cubical body gets turned under the effect of tangential force.

\[
\phi = \frac{x}{L}
\]

- When a beam is bent both compression strain as well as an extension strain is produced.

### 7.7 Stress-strain Curve

(1) When the strain is small (region OP) stress is proportional to strain. This is the region where the so called Hooke’s law is obeyed. The point P is called limit of proportionality and slope of line OP gives the Young’s modulus Y of the material of the wire. \[Y = \tan \theta\].

(2) Point E known as elastic limit or yield-point.

(3) Between EA, the strain increases much more.

(4) The region EABC represents the plastic behaviour of the material of wire.

(5) Stress-strain curve for different materials.
Brittle material | Ductile material | Elastomers
--- | --- | ---
![Stress vs Strain Graph](image)

The plastic region between \( E \) and \( C \) is small for brittle material and it will break soon after the elastic limit is crossed.

The material of wire have a good plastic range and such materials can be easily changed into different shapes and can be drawn into thin wires.

For elastomers and strain produced is much larger than the stress applied. Such materials have no plastic range and the breaking point lies very close to elastic limit. Example rubber.

### 7.8 Hooke's law and Modulus of Elasticity.

According to this law, within the elastic limit, stress is proportional to the strain.

\[
\text{i.e. stress} \propto \text{strain or } \frac{\text{stress}}{\text{strain}} = \text{constant} = E
\]

The constant \( E \) is called modulus of elasticity.

1. It’s value depends upon the nature of material of the body and the manner in which the body is deformed.
2. It’s value depends upon the temperature of the body.
3. It’s value is independent of the dimensions of the body.

There are three modulii of elasticity namely Young's modulus (\( Y \)), Bulk modulus (\( K \)) and modulus of rigidity (\( \eta \)) corresponding to three types of the strain.

### 7.9 Young's Modulus (\( Y \)).

It is defined as the ratio of normal stress to longitudinal strain within limit of proportionality.

\[
Y = \frac{\text{Normal stress}}{\text{longitudinal strain}} = \frac{F / A}{1 / L} = \frac{FL}{AI}
\]
Thermal stress: If a rod is fixed between two rigid supports, due to change in temperature its length will change and so it will exert a normal. This stress is called thermal stress. Thermal stress = \( Y\alpha \Delta \theta \) force produced in the body = \( YA\alpha \Delta \theta \)

7.10 Work Done in Stretching a Wire.

In stretching a wire work is done against internal restoring forces. This work is stored in the wire as elastic potential energy or strain energy.

\[
\text{\therefore Energy stored in wire } U = \frac{1}{2} \frac{YA l^2}{L} = \frac{1}{2} FL \quad (I = \text{change in length})
\]

Energy stored in per unit volume of wire.

\[
\frac{1}{2} \times \text{stress} \times \text{strain} = \frac{1}{2} \times Y \times (\text{strain})^2 = \frac{1}{2Y} (\text{stress})^2
\]

7.11 Breaking of Wire.

When the wire is loaded beyond the elastic limit, then strain increases much more rapidly. The maximum stress corresponding to \( B \) (see stress-strain curve) after which the wire begin to flow and breaks, is called breaking stress or tensile strength and the force by application of which the wire breaks is called the breaking force.

(i) Breaking force depends upon the area of cross-section of the wire
(ii) Breaking stress is a constant for a given
(iii) Breaking force is independent of the length of wire.
(iv) Breaking force \( \propto \pi r^2 \).
(v) Length of wire if it breaks by its own weight.

\[
L = \frac{P}{dg}
\]

7.12 Bulk Modulus.

Then the ratio of normal stress to the volumetric strain within the elastic limits is called as Bulk modulus.
This is denoted by $K$.

\[ K = \frac{\text{Normal stress}}{\text{Volumetric strain}}; \quad K = \frac{F/A}{-\Delta V/V} = -\frac{pV}{\Delta V} \]

where $p = \text{increase in pressure}$, $V = \text{original volume}$; $\Delta V = \text{change in volume}$

The reciprocal of bulk modulus is called compressibility.

\[ C = \text{compressibility} = \frac{1}{K} = \frac{\Delta V}{pV} \]

S.I. unit of compressibility is $\text{N}^{-1}\text{m}^2$ and C.G.S. unit is $\text{dyne}^{-1}\text{cm}^2$.

Gases have two bulk moduli, namely isothermal elasticity $E_\theta$ and adiabatic elasticity $E_f$.

**7.13 Modulus of Rigidity.**

Within limits of proportionality, the ratio of tangential stress to the shearing strain is called modulus of rigidity of the material of the body and is denoted by, i.e.

\[ \eta = \frac{\text{shear Stress}}{\text{Shear strain}} = \frac{F/A}{\phi} = \frac{F}{A\phi} \]

Only solids can exhibit a shearing as these have definite shape.

**7.14 Poisson's Ratio.**

Lateral strain: The ratio of change in radius to the original radius is called lateral strain.

*Longitudinal strain*: The ratio of change in length to the original length is called longitudinal strain. The ratio of lateral strain to longitudinal strain is called Poisson's ratio ($\sigma$).

\[ \text{i.e. } \sigma = \frac{\text{Lateral strain}}{\text{Longitudinal strain}} \]

**7.15 Factors Affecting Elasticity.**

(1) *Hammering and rolling*: This result in increase in the elasticity of material.
(2) **Annealing**: Annealing results in decrease in the elasticity of material.

(3) **Temperature**: Elasticity decreases with rise in temperature but the elasticity of invar steel (alloy) does not change with change of temperature.

(4) **Impurities**: The type of effect depends upon the nature of impurities present in the material.

### 7.16 Practical Applications of Elasticity.

(i) The thickness of the metallic rope used in the crane is decided from the knowledge of elasticity.

(ii) Maximum height of a mountain on earth can be estimated.

(iii) A hollow shaft is stronger than a solid shaft made of same mass, length and material.

### 7.17 Intermolecular Force.

The force of attraction or repulsion acting between the molecules are known as intermolecular force. The nature of intermolecular force is electromagnetic.

The intermolecular forces of attraction may be classified into two types.

<table>
<thead>
<tr>
<th>Cohesive force</th>
<th>Adhesive force</th>
</tr>
</thead>
<tbody>
<tr>
<td>The force of attraction between molecules of same substance is called the force of cohesion. This force is lesser in liquids and least in gases.</td>
<td>The force of attraction between the molecules of the different substances is called the force of adhesion.</td>
</tr>
</tbody>
</table>

### 7.18 Surface Tension

The property of a liquid due to which its free surface tries to have minimum surface area is called surface tension. A small liquid drop has spherical shape due to surface tension. Surface tension of a liquid is measured by the force acting per unit length on either side of an imaginary line drawn on the free surface of liquid. then $T = (F/L)$.

(1) It depends only on the nature of liquid and is independent of the area of surface or length of line considered.

(2) It is a scalar as it has a unique direction which is not to be specified.
(3) **Dimension**: \([\text{MT}^{-2}]\). (Similar to force constant)

(4) **Units**: \(N/m\) (S.I.) and \(\text{Dyne/cm}\) [C.G.S.]

### 7.19 Factors Affecting Surface Tension.

1. **Temperature**: The surface tension of a liquid decreases with rise of temperature.

   \[T_t = T_0(1 - \alpha t)\]

   where \(T_t\) and \(T_0\) are the surface tensions at \(t^\circ C\) and \(0^\circ C\) respectively and \(\alpha\) is the temperature coefficient of surface tension.

2. **Impurities**: A highly soluble substance like sodium chloride when dissolved in water, increases the surface tension of water. But the sparingly soluble substances like phenol when dissolved in water, decreases the surface tension of water.

### 7.20 Surface Energy.

The potential energy of surface molecules per unit area of the surface is called surface energy.

**Unit**: \(\text{Joule/m}^2\) (S.I.) \(\text{erg/cm}^2\) (C.G.S.)

**Dimension**: \([\text{MT}^{12}]\)

\[W = T \times \Delta A\] \([\Delta A = \text{Total increase in area of the film from both the sides}]\]

\text*i.e. surface tension may be defined as the amount of work done in increasing the area of the liquid surface by unity against the force of surface tension at constant temperature.*

### 7.21 Splitting of Bigger Drop.

When a drop of radius \(R\) splits into \(n\) smaller drops, (each of radius \(r\)) then surface area of liquid increases. \(R^3 = nr^3\)

Work done = \(T \times \Delta A = T \left[\text{Total final surface area of } n\text{ drops} - \text{surface area of big drop}\right] = T\left[n\pi r^2 - 4\pi R^2\right]\).

### 7.22 Excess Pressure.

Excess pressure in different cases is given in the following table:
### Plane surface

<table>
<thead>
<tr>
<th>Concave surface</th>
<th>Plane surface</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\Delta P = 0$</td>
<td>$\Delta P = 0$</td>
</tr>
</tbody>
</table>

### Convex surface

<table>
<thead>
<tr>
<th>Drop</th>
<th>Convex surface</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\Delta P = \frac{2T}{R}$</td>
<td>$\Delta P = \frac{2T}{R}$</td>
</tr>
</tbody>
</table>

### Bubble air

<table>
<thead>
<tr>
<th>Bubble in liquid</th>
<th>Bubble air</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\Delta P = \frac{4T}{R}$</td>
<td>$\Delta P = \frac{2T}{R}$</td>
</tr>
</tbody>
</table>

### 7.23 Shape of Liquid Meniscus

The curved surface of the liquid is called meniscus of the liquid.

- If $F_c = \sqrt{2F_a}$
  - $\tan \alpha = \infty \therefore \alpha = 90^\circ$ i.e. the resultant force acts vertically downwards. Hence the liquid meniscus must be horizontal.
- If $F_c < \sqrt{2F_a}$
  - $\tan a$ is positive $\therefore a$ is acute angle i.e. the resultant force directed outside the liquid. Hence the liquid meniscus must be concave upward.
- If $F_c > \sqrt{2F_a}$
  - $\tan \alpha$ is negative $\therefore \alpha$ is obtuse angle i.e. the resultant force directed inside the liquid. Hence the liquid meniscus must be convex upward.

**Examples:**
- Pure water in silver coated capillary tube.
- Water in glass capillary tube.
- Mercury in glass capillary tube.
7.24 Angle of Contact

Angle of contact between a liquid and a solid is defined as the angle enclosed between the tangents to the liquid surface and the solid surface inside the liquid, both the tangents being drawn at the point of contact of the liquid with the solid.

\[
\theta < 90^\circ; F_a > \frac{F}{\sqrt{2}}
\]

- Concave meniscus. Liquid wets the solid surface.

\[
\theta < 90^\circ; F_a < \frac{F}{\sqrt{2}}
\]

- Plane meniscus. Liquid does not wet the solid surface.

\[
\theta > 90^\circ; F_a < \frac{F}{\sqrt{2}}
\]

- Convex meniscus. Liquid does not wet the solid surface.

(i) Its value lies between 0° and 180°

\[\theta = 0^\circ\] for pure water and glass, \(\theta = 90^\circ\) for water and silver

(ii) On increasing the temperature, angle of contact decreases.

(iii) Soluble impurities increases the angle of contact.

(iv) Partially soluble impurities decreases the angle of contact.

7.25 Capillarity.

If a tube of very narrow bore (called capillary) is dipped in a liquid, it is found that the liquid in the capillary either ascends or descends relative to the surrounding liquid. This phenomenon is called capillarity.

The cause of capillarity is the difference in pressures on two sides curved surface of liquid.

7.26 Ascent Formula.

When one end of capillary tube of radius \(r\) is immersed into a liquid of density \(d\) which wets the sides of the capillary \(R = \text{radius of curvature of liquid meniscus}\).

\[T = \text{surface tension of liquid}\]

\[P = \text{atmospheric pressure}\]

\[h = \frac{2T \cos \theta}{\text{rdg}}\]
IMPORTANT POINTS

(i) The capillary rise depends on the nature of liquid and solid both i.e. on \( T, d, \theta \) and \( R \).

(ii) Capillary action for various liquid-solid pair.

<table>
<thead>
<tr>
<th>Meniscus</th>
<th>Angle of contact</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concave</td>
<td>( \theta &lt; 90^\circ )</td>
<td>Rises</td>
</tr>
<tr>
<td>Plane</td>
<td>( \theta = 90^\circ )</td>
<td>No rise no fall</td>
</tr>
<tr>
<td>Convex</td>
<td>( \theta &gt; 90^\circ )</td>
<td>Fall</td>
</tr>
</tbody>
</table>

7.27 Pressure

The normal force exerted by liquid at rest on a given surface in contact with it is called thrust of liquid on that surface.

If \( F \) be the normal force acting on a surface of area \( A \) in contact with liquid, then pressure exerted by liquid on this surface is \( P = F/\text{Area} = F/A \).

1. **Units**: N/m\(^2\) or Pascal (SI) and Dyne/cm\(^2\) (CGS).

2. **Dimension**: \([P] = \left[ \frac{F}{A} \right] = \left[ \frac{\text{ML}^{-1}\text{T}^{-2}}{\text{L}^2} \right] = \text{ML}^{-1}\text{T}^{-2}\).

3. Pressure is a tensor quantity.

4. **Atmospheric pressure**: \( \text{atm} = 1.01 \times 10^5 \text{ Pa} = 1.01 \text{ bar} = 1 \text{ torr} \).

5. If \( P_0 \) is the atmospheric pressure then for a point at depth \( h \) below the surface of a liquid of density \( \rho \), hydrostatic pressure \( P \) is given by \( P = P_0 + \rho gh \).

6. **Gauge pressure**: The pressure difference between hydrostatic pressure \( P \) and atmospheric pressure \( P_0 \) is called gauge pressure. \( P - P_0 + \rho gh \).

7.28 Pascal's Law

The increase in pressure at one point of the enclosed liquid in equilibrium of rest is transmitted equally to all other points of the liquid and also to the walls of the container, provided the effect of gravity is neglected.

Example: Hydraulic lift, hydraulic press and hydraulic brakes.
7.29 Archimedes Principle

When a body is immersed partly or wholly in a fluid, in rest it is buoyed up with a force equal to the weight of the fluid displaced by the body. This principle is called Archimedes principle. Apparent weight of the body of density \( \rho \) when immersed in a liquid of density \( \sigma \).

\[
\text{Apparent weight} = \text{Actual weight} - \text{Upthrust} = W - F_{up} = V\rho g - V\sigma g = V(\rho - \sigma)g
\]

\[
V = V\rho g \left(1 - \frac{\sigma}{\rho}\right)
\]

\[
W_{\text{app}} = W\left(1 - \frac{\sigma}{\rho}\right)
\]

1. Relative density of a body (R.D.) = \( \frac{\text{Weight of body in air}}{\text{Weight in air} - \text{weight in water}} = \frac{w_1}{w_1 - w_2} \)

2. If the loss of weight of a body in water is ‘a’ while in liquid is ‘b’

\[
\therefore \frac{\sigma_L}{\sigma_w} = \frac{\text{Upthrust on body in liquid}}{\text{Upthrust on body in water}} = \frac{\text{Loss of weight in liquid}}{\text{Loss of weight in water}} = \frac{a}{b} = \frac{W_{\text{air}} - W_{\text{liquid}}}{W_{\text{air}} - W_{\text{water}}}
\]

7.30 Streamline, Laminar and Turbulent Flow.

1. **Stream line flow**: Stream line flow of a liquid is that flow in which each element of the liquid passing through a point travels along the same path and with the same velocity as the preceding element passes through that point.

   The two streamlines cannot cross each other and the greater is the crowding of streamlines at a place, the greater is the velocity of liquid particles at that place.

2. **Laminar flow**: If a liquid is flowing over a horizontal surface with a steady flow and moves in the form of layers of different velocities which do not mix with each other, then the flow of liquid is called laminar flow.

   In this flow the velocity of liquid flow is always less than the critical velocity of the liquid.

3. **Turbulent flow**: When a liquid moves with a velocity greater than its critical velocity, the motion of the particles of liquid becomes disordered or irregular. Such a flow is called a turbulent flow.
7.31 Critical Velocity

The critical velocity is that velocity of liquid flow upto which its flow is streamlined and above which its flow becomes turbulent.

7.32 Equation of Continuity.

The equation of continuity is derived from the principle of conservation of mass. For an incompressible, streamlined and non-viscous liquid product of area of cross section of tube and velocity of liquid remains constant.

\[ a_1 v_1 = a_2 v_2 \]

or \[ a v = \text{constant} \]

or \[ a \alpha v = \text{constant} \]

When water falls from a tap, the velocity of falling water under the action of gravity will increase with distance from the tap (i.e., \( v_2 > v_1 \)). So in accordance with continuity equation the cross section of the water stream will decrease (i.e., \( A_2 < A_1 \)), i.e., the falling stream of water becomes narrower.

7.33 Energy of a Flowing Fluid

<table>
<thead>
<tr>
<th>Pressure Energy</th>
<th>Potential energy</th>
<th>Kinetic energy</th>
</tr>
</thead>
<tbody>
<tr>
<td>It is the energy possessed by a liquid by virtue of its pressure. It is the measure of work done in pushing the liquid against pressure without imparting any velocity to it.</td>
<td>It is the energy possessed by liquid by virtue of its height or position above the surface of earth or any reference level taken as zero level.</td>
<td>It is the energy possessed by a liquid by virtue of its motion or velocity.</td>
</tr>
<tr>
<td>Pressure energy of the liquid ( PV )</td>
<td>Potential energy of the liquid ( mgh )</td>
<td>Kinetic energy of the liquid ( \frac{1}{2}mv^2 )</td>
</tr>
<tr>
<td>Pressure energy per unit mass of the liquid ( \frac{P}{p} )</td>
<td>Potential energy per unit mass of the liquid ( gh )</td>
<td>Kinetic energy per unit mass of the liquid ( \frac{1}{2}v^2 )</td>
</tr>
<tr>
<td>Pressure energy per unit volume of the liquid ( P )</td>
<td>Potential energy per unit volume of the liquid ( pgh )</td>
<td>Kinetic energy per unit volume of the liquid ( \frac{1}{2}\rho v^2 )</td>
</tr>
</tbody>
</table>
7.34 Bernoulli’s Theorem.

According to this theorem the total energy (pressure energy, potential energy and kinetic energy) per unit volume or mass of an incompressible and non-viscous fluid in steady flow through a pipe remains constant throughout the flow.

\[ P + \rho gh + \frac{1}{2} \rho v^2 = \text{constant} \]

(i) Bernoulli’s theorem for unit mass of:
\[ \frac{P}{\rho} + gh + \frac{1}{2} v^2 = \text{constant} \]

(ii) Dividing above equation by \( g \) we get
\[ \frac{P}{\rho g} + h + \frac{v^2}{2g} = \text{constant} \]

Here \( \frac{P}{\rho g} \) is called pressure head, \( h \) is called gravitational head and \( \frac{v^2}{2g} \) is called velocity head.

7.35 Applications of Bernoulli’s Theorem

(i) **Attraction between two closely parallel moving boats**

(ii) **Working of an aeroplane**: ‘dynamic lift’
\[ (= \text{pressure difference} \times \text{area of wing}) \]

(iii) **Action of atomiser** :

(iv) **Blowing off roofs by wind storms**

(v) **Magnus effect**: When a spinning ball is thrown, it deviates from its usual path in flight. This effect is called Magnus effect.

(vi) **Venturimeter**: It is a device used for measuring the rate of flow of liquid through pipes.

Rate of flow of liquid \( V = a_1 a_2 \sqrt{\frac{2gh}{a_1^2 - a_2^2}} \)
7.36 Velocity of Efflux

Velocity of efflux from a hole made at a depth \( h \) below the free surface of the liquid (of depth \( H \)) is given by \( v = \sqrt{2gh} \).

Which is same as the final speed of a free falling object from rest through a distance \( h \). This result is known as Torricelli’s theorem.

7.37 Viscosity and Newton’s law of Viscous Force

The property of a fluid due to which it opposes the relative motion between its different layers is called viscosity (or fluid friction or internal friction) and the force between the layers opposing the relative motion is called viscous force.

Viscous force \( F \) is proportional to the area of the plane \( A \) and the velocity gradient \( \frac{d\nu}{dx} \) in a direction normal to the layer,

\[
i.e., \quad F = -\eta A \frac{d\nu}{dx}
\]

Where \( \eta \) is a constant called the coefficient of viscosity. Negative sign is employed because viscous force acts in a direction opposite to the flow of liquid.

1. Units: dyne-s-cm\(^{-2}\) or Poise (C.G.S. system);
   Newton-s-m\(^{-2}\) or Poiseuille or decapoise (S.I. system)
   1 Poiseuille = 1 decapoise = 10 Poise
2. Dimension: \([\text{ML}^{-1}\text{T}^{-1}]\)
3. With increase in pressure, the viscosity of liquids (except water) increases while that of gases is independent of pressure. The viscosity of water decreases with increase in pressure.
4. Solid friction is independent of the area of surfaces in contact and the relative velocity between them.
5. Viscosity represents transport of momentum, while diffusion and conduction represents transport of mass and energy respectively.
The viscosity of gases increases with increase of temperature.
The viscosity of liquid decreases with increase of temperature.

**7.38 Stoke’s Law and Terminal Velocity**

Stokes established that if a sphere of radius $r$ moves with velocity $v$ through a fluid of viscosity $\eta$, the viscous force opposing the motion of the sphere is $F = 6\pi r v$ (stokes law)

If a spherical body of radius $r$ is dropped in a viscous fluid, it is first accelerated and then it’s acceleration becomes zero and it attains a constant velocity called terminal velocity.

**Terminal velocity**

\[
V = \frac{2}{9} \frac{r^2 (\rho - \sigma) g}{\eta}
\]

(i) If $\rho > \sigma$ then body will attain constant velocity in downward direction.

(ii) If $\rho < \sigma$ then body will attain constant velocity in upward direction.

*Example*: Air bubble in a liquid and clouds in sky.

(iii) Terminal velocity graph:

![Terminal Velocity Graph](image)

**7.39 Poiseuille’s Formula.**

Poiseuille studied the stream–line flow of liquid in capillary tubes. He found that if a pressure difference ($P$) is maintained across the two ends of a capillary tube of length $l$ and radius $r$, then the volume of liquid coming out of the tube per second is

\[
V = \frac{\pi Pr^4}{8\eta l} \text{ (Poiseulle’s equation)}
\]

This equation also can be written as, $V = \frac{P}{R}$ where $R = R = \frac{8\eta l}{\pi r^4}$

$R$ is called as liquid resistance.
3.40 Stefan’s Law.

According to it the radiant energy emitted by a perfectly black body per unit area per sec \( (i.e. \text{ emissive power of black body}) \) is directly proportional to the fourth power of its absolute temperature.

\[ E \propto T^4 \text{ or } E = \sigma T^4 \]

where \( \sigma = \text{Stefan's constant having dimension } [MT^{-3}T^{-4}] \) and value \( 5.67 \times 10^{-8} \text{ W/m}^2\text{K}^4 \).

(i) If \( e \) is the emissivity of the body then \( E = e\sigma T^4 \)

(ii) If \( Q \) is the total energy radiated by the body then \( Q = At_e T^4 \)

(iii) If a body at temperature \( T \) is surrounded by a body at temperature \( T_0 \), then \( E = e\sigma \left( T^4 - T_0^4 \right) \).

Nature of thermal Radiation

- Radiation emitted by a black body is a mixture of waves of different wavelengths and only a small range of wavelength has significant contribution in the total radiation.

- A body is heated at different temperature and Energy of radiation is plotted against wavelength is plotted for different temperature we get following curves.

- These curves show
  
  (i) Energy is not uniformly distributed in the radiation spectrum of black body.
(ii) At a given temperature the intensity of radiations increases with increase in wavelength, becomes maximum at particular wavelength and further increase in wavelength leads to decrease in intensity of heat radiation.

(iii) Increase in temperature causes increase in energy emission for all wavelengths.

(iv) Increase in temperature causes decrease in $\lambda_m$, where $\lambda_m$ is wavelength corresponding to highest intensity. This wavelength $\lambda_m$ is inversely preoperational to the absolute temperature of the emitter. $\lambda_m \ T = b$

where $b$ is a constant and this equation is known as Wein’s displacement law. $b = 0.2896 \times 10^{-2} \ mk$ for black body and is known as Wien’s constant.

**VERY SHORT ANSWER TYPE QUESTIONS (1 MARK)**

1. Define term (i) stress (ii) strain
2. Differentiate the properties plasticity and elasticity of material
3. Draw stress - strain curve for elastomers (elastic tissue of Aorta)
4. How are we able to break a wire by repeated bending?
5. What is the value of bulk modulus for an incompressible liquid?
6. Define Poisson’s ratio? Does it have any unit?
7. What is elastic fatigue?
8. Why is it easier to swim in sea water than in the river water?
9. Railway tracks are laid on large sized wooden sleepers. Why?
10. The dams of water reservoir are made thick near the bottom. Why?
11. Why is it difficult to stop bleeding from a cut in human body at high altitude?
12. The blood pressure in human is greater at the feet than at the brain. Why?
13. Define coefficient of viscosity and write its SI unit.
14. Why machine parts get jammed in winter?
15. Why are rain drops spherical?
16. Why do paints and lubricants have low surface tension?
17. What will be the effect of increasing temperature on (i) angle of contact (ii) surface tension.
18. For solids with elastic modulus of rigidity, the shearing force is proportional to shear strain. On what factor does it depend in case of fluids?
19. How does rise in temperature effect (i) viscosity of gases (ii) viscosity of liquids.
20. Explain why detergents should have small angle of contact?
21. Write the dimensions of coefficient of viscosity and surface tension.
22. Obtain a relation between SI unit and cgs unit of coefficient of viscosity.
23. Explain, how the use of parachute helps a person jumping from an aeroplane.
24. Why two ships moving in parallel directions close to each other get attracted?
25. Why the molecules of a liquid lying near the free surface possess extra energy?
26. Why is it easier to wash clothes in hot water soap solution?
27. Why does mercury not wet glass?
28. Why ends of a glass tube become rounded on heating?
29. What makes rain coats water proof?
30. What happens when a capillary tube of insufficient length is dipped in a liquid?
31. Does it matter if one uses gauge pressure instead of absolute pressure in applying Bernoulli’s equation?
32. State Wein's displacement law for black body radiation.
33. State Stefan Boltzmann law.
34. Name two physical changes that occur on heating a body.
35. Distinguish between heat and temperature.
36. Which thermometer is more sensitive a mercury or gas thermometer?
37. Metal disc has a hole in it. What happens to the size of the hole when disc is heated?
38. Name a substance that contracts on heating.
39. A gas is free to expand what will be its specific heat?
40. Is the bulb of a thermometer made of diathermic or adiabatic wall?
41. What is the absorptive power of a perfectly black body?
42. At what temperature does a body stop radiating?
43. If Kelvin temperature of an ideal black body is doubled, what will be the effect on energy radiated by it?
44. In which method of heat transfer does gravity not play any part?
45. Give a plot of Fahrenheit temperature versus Celsius temperature
46. Why birds are often seen to swell their feather in winter?
47. A brass disc fits snugly in a hole in a steel plate. Should we heat or cool the system to loosen the disc from the hole.

**SHORT ANSWER TYPE QUESTIONS (2 MARKS)**

48. State Hooke’s law. Deduce expression for young's modulus of material of a wire of length ‘l’, radius of cross-section ‘r’ loaded with a body of mass M producing an extension Δl in it.

49. A wire of length l area of crossection A and young's modulus Y is stretched by an amount x. What is the work done?
50. Prove that the elastic potential energy per unit volume is equal to \( \frac{1}{2} \times \text{stress} \times \text{strain} \).

51. Define the term bulk modulus. Give its SI unit. Give the relation between bulk modulus and compressibility.

52. Define shear modulus. With the help of a diagram explain how shear modulus can be calculated.

53. Which is more elastic steel or rubber. Explain.

54. Two wires P and Q of same diameter are loaded as shown in the figure. The length of wire P is L m and its young's modulus is Y N/m\(^2\) while length of wire a is twice that of P and its material has young's modulus half that of P. Compute the ratio of their elongation.

\[
\begin{align*}
\text{m kg} \\
\text{2m kg}
\end{align*}
\]

55. What is Reynold's number? Write its significance. On what factors does it depend.

56. Define surface tension and surface energy. Obtain a relation between them.

57. State and prove Torricelli's theorem for velocity of efflux.

58. Using dimensional method obtain, Stoke's law expression for viscous force \( F = 6\pi \eta a v \)

59. The fig (a) & (b) refer to the steady flow of a non viscous liquid which of the two figures is incorrect? Why?
60. The fig below shows a thin liquid supporting a small weight $4.5 \times 10^{-2}$ N. What is the weight supported by a film of same liquid at the same temperature in fig (b) & (c)? Explain your answer.

61. Two soap bubbles of different diameter are in contact with a certain portion common to both the bubbles. What will be the shape of the common boundary as seen from inside the smaller bubble? Support your answer with a neat diagram and justify your answer.

62. During blood transfusion the needle is inserted in a vein where gauge pressure is $p_g$ and atmospheric pressure is $p$. At what height must the blood container be placed so that blood may just enter the vein. Given density of blood is $\rho$.

63. Why we cannot remove a filter paper from a funnel by blowing air into narrow end.

64. On a hot day, a car is left in sunlight with all windows closed. Explain why it is considerably warmer than outside, after some time?
65. Name the suitable thermometers to measure the following temperatures

(a) −100°C  (b) 80°C
(c) 780°C  (d) 2000°C

66. If a drop of water falls on a very hot iron, it does not evaporate for a long time. Why?

67. The earth without its atmosphere would be inhospitably cold. Why?

68. The coolant used in chemical or in a nuclear plant should have high specific heat. Why?

69. A sphere, a cube and a disc made of same material and of equal masses heated to same temperature of 200°C. These bodies are then kept at same lower temperature in the surrounding, which of these will cool (i) fastest, (ii) slowest, explain.

70. (a) Why pendulum clocks generally go faster in winter and slow in summer.

(b) Why the brake drums of a car are heated when it moves down a hill at constant speed.

71. The plots of intensity versus wavelength for three blackbodies at temperature $T_1$, $T_2$ and $T_3$ respectively are shown.

![Plot of intensity versus wavelength for three blackbodies](image)

Arrange the temperature in decreasing order. Justify your answer.

72. The triple point of water is a standard fixed point in modern thermometry. Why? Why melting point of ice or boiling point of water not used as standard fixed points.
SHORT ANSWER TYPE QUESTIONS (3 MARKS)

73. The knowledge of elasticity useful in selecting metal ropes show its use, in cranes for lifting heavy loads, when rope of steel is used (Elastic limit $30 \times 10^7$ Nm$^{-2}$) if load of $10^5$ kg is to be lifted.

What should be the radius of steel rope? what should we do to increase flexibility of such wire?

74. Stress strain curve for two wires of material A and B are as shown in Fig.

<table>
<thead>
<tr>
<th>Stress</th>
<th>Strain</th>
</tr>
</thead>
<tbody>
<tr>
<td>wire A</td>
<td></td>
</tr>
<tr>
<td>wire B</td>
<td></td>
</tr>
</tbody>
</table>

(a) which material is more ductile?
(b) which material has greater value of young modulus?
(c) which of the two is stronger material?
(d) which material is more brittle?

75. State Pascal's law for fluids with the help of a neat labelled diagram explain the principle and working of hydraulic brakes.

76. A manometer reads the pressure of a gas in an enclosure as shown in the fig (a) when some of the gas is removed by a pump, the manometer reads as in fig (b) The liquid used in manometer is mercury and the atmospheric pressure is 76 cm of mercury, (i) Give absolute and gauge pressure of the gas in the enclosure for cases (a) and (b).
77. How would the levels change in (b) if 13.6 cm of H₂O (immensible with mercury) are poured into the right limb of the manometer in the above numerical.

78. Define Capillarity and angle of contact. Derive an expression for the ascent of a liquid in a capillary tube.

79. The terminal velocity of a tiny droplet is v. N number of such identical droplets combine together forming a bigger drop. Find the terminal velocity of the bigger drop.

80. Two spherical soap bubble coalesce. If v be the change in volume of the contained air, A is the change in total surface area then show that 3PV + 4AT = 0 where T is the surface tension and P is atmospheric pressure.

81. Give the principle of working of venturimeter. Obtain an expression for volume of liquid flowing through the tube per second.

82. A big size balloon of mass M is held stationary in air with the help of a small block of mass M/2 tied to it by a light string such that both float in mid air. Describe the motion of the balloon and the block when the string is cut. Support your answer with calculations.

83. Two vessels have the same base area but different shapes. The first vessel takes twice the volume of water that the second vessel requires to fill up to a particular common height. Is the force exerted by the water on the base of the vessel the same? Why do the vessels filled to same height give different reading on weighing scale.

84. A liquid drop of diameter D breaks up into 27 tiny drops. Find the resulting change in energy. Take surface tension of liquid as σ.

85. Define the coefficients of linear expansion. Deduce relation between it and coefficient of superficial expansion and volume expansion.
86. Describe the different types of thermometers commonly used. Used the relation between temperature on different scales. Give four reasons for using mercury in a thermometer.

87. Two rods of different metals of coefficient of linear expansion $\alpha_1$ and $\alpha_2$ and initial length $l_1$ and $l_2$ respectively are heated to the same temperature. Find relation in $\alpha_1$, $\alpha_2$, $l_1$ and $l_2$ such that difference between their lengths remain constant.

88. Explain why:
   (a) a body with large reflectivity is a poor emitter.
   (b) a brass tumbler feels much colder than a wooden tray on a chilly day.

89. Draw a graph to show the anomalous behaviour of water. Explain its importance for sustaining life under water.

90. A brass wire 1.8 m long at 27°C is held taut with little tension between two rigid supports. If the wire is cooled to a temperature of –39°C, what is the tension developed in the wire, if its diameter is 2.0 mm? Coefficient of linear expansion of brass = 2.0 × 10$^{-5}$°C$^{-1}$, Young's modulus of brass = 0.91 × 10$^{11}$ Pa.

91. Define (i) Specific heat capacity (ii) Heat capacity (iii) Molar specific heat capacity at constant pressure and at constant volume and write their units.

92. What is latent heat? Give its units. With the help of a suitable graph, explain the terms latent heat of fusion and latent heat of vaporisation.

93. What is the effect of pressure on melting point of a substance? What is regelation. Give a practical application of it.

94. What is the effect of pressure on the boiling point of a liquid. Describe a simple experiment to demonstrate the boiling of H$_2$O at a temperature much lower than 100°C. Give a practical application of this phenomenon.

95. State and explains the three modes of transfer of heat. Explains how the loss of heat due to these three modes is minimised in a thermos flask.
96. Define coefficient of thermal conductivity. Two metal slabs of same area of cross-section, thickness \( d_1 \) and \( d_2 \) having thermal conductivities \( K_1 \) and \( K_2 \) respectively are kept in contact. Deduce expression for equivalent thermal conductivity.

**LONG ANSWER TYPE QUESTIONS (5 MARKS)**

97. Draw and discuss stress versus strain graph, explaining clearly the terms elastic limit, permanent set, proportionality limit, elastic hysteresis, tensile strength.

98. Show that there is always an excess pressure on the concave side of the meniscus of a liquid. Obtain an expression for the excess pressure inside (i) a liquid drop (ii) soap bubble (iii) air bubble inside a liquid.

100. Define terminal velocity. Obtain an expression for terminal velocity of a sphere falling through a viscous liquid. Use the formula to explain the observed rise of air bubbles in a liquid.

101. On what factors does the rate of heat conduction in a metallic rod in the steady state depend. Write the necessary expression and hence define the coefficient of thermal conductivity. Write its unit and dimensions.

102. Distinguish between conduction, convection and radiation.

103. What is meant by a block body. Explain how a black body may be achieved in practice. State and explain Stefan's law?

104. State and prove Pascal's law of transmission of fluid pressure. Explain how is Pascal's law applied in a hydraulic lift.

105. Discuss energy distribution of black body radiation spectrum and explain Wein's displacement law of radiation and Stefan's law of heat radiation.

**NUMERICALS**

106. An aluminium wire 1m in length and radius 1mm is loaded with a mass of 40 kg hanging vertically. Young's modulus of Al is \( 7.0 \times 10^{10} \) N/m².
Calculate (a) tensile stress (b) change in length (c) tensile strain and (d) the force constant of such a wire.

107. The average depth of ocean is 2500 m. Calculate the fractional compression \( \frac{\Delta V}{V} \) of water at the bottom of ocean, given that the bulk modulus of water is \( 2.3 \times 10^9 \) N/m\(^2\).

108. A force of \( 5 \times 10^3 \) N is applied tangentially to the upper face of a cubical block of steel of side 30 cm. Find the displacement of the upper face relative to the lower one, and the angle of shear. The shear modulus of steel is \( 8.3 \times 10^{10} \) pa.

109. How much should the pressure on one litre of water be changed to compress it by 0.10%.

110. Calculate the pressure at a depth of 10 m in an Ocean. The density of sea water is 1030 kg/m\(^3\). The atmospheric pressure is \( 1.01 \times 10^5 \) pa.

111. In a hydraulic lift air exerts a force \( F \) on a small piston of radius 5cm. The pressure is transmitted to the second piston of radius 15 cm. If a car of mass 1350 kg is to be lifted, calculate force \( F \) that is to be applied.

112. How much pressure will a man of weight 80 kg f exert on the ground when (i) he is lying and (2) he is standing on his feet. Given area of the body of the man is 0.6 m\(^2\) and that of his feet is 80 cm\(^2\).

113. The manual of a car instructs the owner to inflate the tyres to a pressure of 200 k pa. (a) What is the recommended gauge pressure? (b) What is the recommended absolute pressure (c) If, after the required inflation of the tyres, the car is driven to a mountain peak where the atmospheric pressure is 10% below that at sea level, what will the tyre gauge read?

114. Calculate excess pressure in an air bubble of radius 6mm. Surface tension of liquid is 0.58 N/m.

115. Terminal velocity of a copper ball of radius 2 mm through a tank of oil at 20°C is 6.0 cm/s. Compare coefficient of viscosity of oil. Given \( \rho_{\text{cu}} = 8.9 \times 10^3 \) kg/m\(^3\), \( \rho_{\text{oil}} = 1.5 \times 10^3 \) kg/m\(^3\)

116. Calculate the velocity with which a liquid emerges from a small hole in the side of a tank of large cross-sectional area if the hole is 0.2m below the surface liquid (\( g = 10 \) ms\(^{-2}\)).
117. A soap bubble of radius 1 cm expands into a bubble of radius 2 cm. Calculate the increase in surface energy if the surface tension for soap is 25 dyne/cm.

118. A glass plate of 0.20 m² in area is pulled with a velocity of 0.1 m/s over a larger glass plate that is at rest. What force is necessary to pull the upper plate if the space between them is 0.003 m and is filled with oil of viscosity 0.01 Ns/m²?

119. The area of cross-section of a water pipe entering the basement of a house is 4 × 10⁻⁴ m². The pressure of water at this point is 3 × 10⁵ N/m², and speed of water is 2 m/s. The pipe tapers to an area of cross section of 2 × 10⁻⁴ m², when it reaches the second floor 8 m above the basement. Calculate the speed and pressure of water flow at the second floor.

120. A large bottle is fitted with a siphon made of capillary glass tubing. Compare the times taken to empty the bottle when it is filled (i) with water (ii) with petrol of density 0.8 cgs units. The viscosity of water and petrol are 0.01 and 0.02 cgs units respectively.

121. The breaking stress for a metal is 7.8 × 10⁹ Nm⁻². Calculate the maximum length of the wire made of this metal which may be suspended without breaking. The density of the metal = 7.8 × 10⁻³ kg m⁻³. Take g = 10 N kg⁻¹.

122. Two stars radiate maximum energy at wavelength, 3.6 × 10⁻⁷ m and 4.8 × 10⁻⁷ m respectively. What is the ratio of their temperatures?

123. Find the temperature of 149°F on kelvin scale.

124. A metal piece of 50 g specific heat 0.6 cal/g°C initially at 120°C is dropped in 1.6 kg of water at 25°C. Find the final temperature of the mixture.

125. A iron ring of diameter 5.231 m is to be fixed on a wooden rim of diameter 5.243 m both initially at 27°C. To what temperature should the iron ring be heated so as to fit the rim (Coefficient of linear expansion of iron is 1.2 × 10⁵ k⁻¹)?

126. 100 g of ice at 0°C is mixed with 100 g of water at 80°C. The resulting temperature is 6°C. Calculate the heat of fusion of ice.
127. Calculate heat required to convert 3kg of water at 0°C to steam at 100°C. Given specific heat capacity of H₂O = 4186 J kg⁻¹ k⁻¹ and latent heat of steam = 2.256 × 10⁶ J/kg

128. Calculate the stress developed inside a tooth cavity that filled with copper. When hot tea at temperature 57°C is drunk, you can take body (tooth) temperature to be 37°C and α = 1.7 × 10⁻⁵/°C bulk modules for copper = 140 × 10⁹ Nm⁻².

129. A body at temperature 94°C cools to 86°C in 2 min. What time will it take to cool from 82°C to 78°C. The temperature of surrounding is 20°C.

130. A body re-emits all the radiation it receives. Find surface temperature of the body. Energy received per unit area per unit time is 2.835 watt/m² and α = 5.67 × 10⁻⁸ W m⁻² k⁻⁴

**VERY SHORT ANSWERS (1 MARK)**

4. Repeated bending of wire decreases elastic strength and therefore it can be broken easily.

5. \( K = \frac{\text{stress}}{\text{strain}} = \frac{\text{stress}}{\text{o}} = \infty \text{ Infinity} \)

6. Poisson’s ratio is the ratio of lateral strain to the longitudinal strain. It has no units.

7. It is the loss in strength of a material caused due to repeated alternating strains to which the material is subjected.

8. The density of sea water is more than the density of river water, hence sea water gives more up thrust for the same volume of water displaced.

9. This spreads force due to the weight of the train on a larger area and hence reduces the pressure considerably and in turn prevents yielding of the ground under the weight of the train.

10. Pressure exerted by liquid column = h p g so as ‘h’ increases p increases so to with stand high pressure dams are made thick near the bottom.

11. The atmospheric pressure is low at high altitudes. Due to greater pressure difference in blood pressure and the atmospheric pressure, it is difficult to stop bleeding from a cut in the body.
12. The height of blood column is quite large at feet than at the brain, hence blood pressure at feet is greater.

14. In winter i.e. at low temperature the viscosity of lubricants increases.

15. Due to surface tension the drops try to occupy minimum surface area, and for a given volume sphere has minimum surface area.

16. Low surface tension makes paints and lubricants to spread more effectively.

17. Angle of contact increases with increase of temperature while surface tension generally decreases with increase of temperature.

18. Rate of Shear Strain.

19. Viscosity of gases increases while viscosity of liquid decreases.

20. Detergents should have small angle of contact so that they have low surface tension and greater ability to wet a surface. Further as \( h = \frac{2T \cos \theta}{\rho g} \) i.e. \( \theta \) is small \( \cos \theta \) will be large so \( h \) i.e. penetration will be high.

21. \([\eta]\) = \(M^1L^{-1}T^{-1}\)

\([\eta] = M^1T^{-2}L^0\)

22. c.g.s unit of \(\eta\) = poise

S.I Unit of \(\eta\) = poiseuille or deca poise

1 poise = 1 g cm\(^{-1}\) s\(^{-2}\) = 10\(^{-1}\) kg m\(^{-1}\) s\(^{-1}\)

= 0.1 poiseuille

23. Viscous force on the parachute is large as \(F = 6\pi \eta r v\), \(F \propto r\), so its terminal velocity becomes small so the person hits the ground with this small velocity and does not get injured.

24. According to Bernoulli’s theorem for horizontal flow \(P + \frac{1}{2} \rho v^2 = \text{constant.}\)

As speed of water between the ships is more than outside them pressure between them gets reduced & pressure outside is more so the excess pressure pushes the ships close to each other therefore they get attracted.
25. The molecules in a liquid surface have a net downward force (cohesion) on them, so work done in bringing them from within the body of liquid to the surface increases surface energy.

26. Hot water soap solution has small surface tension therefore can remove the dirt from clothes by wetting them effectively.

27. Mercury does not wet glass because of larger cohesive force between Hg-Hg molecules than the adhesive forces between mercury-glass molecules.

28. When glass is heated, it melts. The surface of this liquid tends to have a minimum area. For a given volume, the surface area is minimum for a sphere. This is why the ends of a glass tube become rounded on heating.

29. The angle of contact between water and the material of the rain coat is obtuse. So the rain water does not wet the rain coat.

30. When a capillary tube of insufficient length is dipped in a liquid, the radius of curvature of the meniscus increase so that \( hr = \text{constant} \). That is pressure on concave side becomes equal to pressure exerted by liquid column so liquid does not overflow.

31. No. Unless the atmospheric pressures at the two points where Bernoulli’s equation is applied, are significantly different.

34. Volume and electrical resistance.

36. Gas thermometer is more sensitive as coefficient of expansion of Gas is more than mercury.

37. Expansion is always outward, therefore the hole size increased on heating.

38. Ice

39. Infinity

40. The temperature above which molar heat capacity of a solid substance becomes constant.

41. One.

42. At 0K.
43. \( E \alpha T^4 \quad \frac{E_2}{E_1} = \left( \frac{T_2}{T_1} \right)^4 = \left( \frac{2T_1}{T_1} \right)^4 = 16 \)

\[ \therefore E_2 = 16 E_1 \]

44. In conduction and radiation

45. \[ \text{Graph showing} \quad \text{Dt}_1 = 180 \]

46. When birds swell their feathers, they trap air in the feather. Air being a poor conductor prevents loss of heat and keeps the bird warm.

47. The temp, coefficient of linear expansion for brass is greater than that for steel. On cooling the disc shrinks to a greater extent than the hole, and hence brass disc gets lossened.

**SHORT ANSWERS (2 MARKS)**

49. Restoring force in extension \( x = F = \frac{AYx}{L} \)

Work done in stretching it by \( dx = dw = F \cdot dx \)

Work done in stretching it from zero to \( x = W = \int dw = \int_0^x F \, dx \)

\[ W = \int_0^x \frac{AYx}{L} \, dx = \frac{1}{2} \frac{AYx^2}{L} \]

50. Energy Density = \( \frac{\text{Energy}}{\text{Volume}} = \frac{1}{2} \frac{AYx^2}{AL} \)
\[
\frac{1}{2} \left( \frac{AYx}{L} \right) L
\]

\[
\frac{1}{2} \frac{F}{A} \frac{x}{L} \therefore \left[ Y = \frac{FL}{Ax} \right]
\]

\[
= \frac{1}{2} \text{stress} \times \text{strain}
\]

53. \[ Y_s = \frac{F}{A} \frac{1}{\Delta l_s} \]

\[ Y_r = \frac{F}{A} \frac{1}{\Delta l_r} \]

For same force applied to wires made of steel & rubber of same length and same area of cross section

\[ \Delta l_s < \Delta l_r \]

\[ \frac{Y_s}{Y_r} = \frac{\Delta l_r}{\Delta l_s} > 1 \]

\[ \therefore Y_s > Y_r \]

54. \[ \Delta l_p = \frac{3mg}{A} \times \frac{L}{Y} \]

\[ \Delta l_2 = \frac{2mg}{A} \times \frac{2L}{Y} = \frac{8mgL}{A} \times \frac{1}{Y}, \therefore \frac{\Delta l_p}{\Delta l_2} = 3 \]

55. Definition of Reynold number \( N_R \) is the ratio of inertial force to viscous force.

59. Fig. (a) is correct.

At the constriction, the area of cross section is small so liquid velocity is large, consequently pressure must be small so height of liquid must be less.

60. The weight supported by (b) & (c) are same as that in (a) and is equal to \( 4.5 \times 10^{-2} \) N.
The weight supported = $2 \sigma I$, where $\sigma$ is surface tension and $I$ is the length which is same in all the three cases, hence weight supported is same.

61. When seen from inside the smaller bubble the common surface will appear $2T$ concave as (1) the pressure (excess) $= \frac{2T}{R}$ will be greater for concave surface & as $R$ is small for the smaller bubble, the pressure will be greater.

62. $P_g = pg$  
   $h = \frac{P_g}{pg}$

63. When air is blown into the narrow end its velocity in the region between filter paper and glass increases. This decreases the pressure. The filter paper gets more firmly held with the wall of the tunnel.

64. Glass transmits 50% of heat radiation coming from a hot source like sun but does not allow the radiation from moderately hot bodies to pass through it.

65. (a) Gas thermometer;  
     (b) Mercury thermometer;  
     (c) Platinum resistance thermometer;  
     (d) Radiation pyrometer.

66. A vapour film is formed between water drop and the hot iron. Vapour being a poor conductor of heat makes the water droplet to evaporate slowly.
67. Due to greenhouse effect, the presence of atmosphere prevents heat radiations received by earth to go back. In the absence of atmosphere radiation will go back at night making the temperature very low and inhospitable.

68. So, that it absorbs more heat with comparatively small change in temperature and extracts large amount of heat.

69. Rate of energy emission is directly proportional to area of surface for a given mass of material. Surface area of sphere is least and that of disc is largest. Therefore cooling of (i) disc is fastest and (ii) sphere is slowest.

70. (a) Time period of pendulum = \( T = 2\pi \sqrt{\frac{l}{g}} \) or \( T \propto \sqrt{l} \)

In winter \( l \) becomes shorter so its time period reduces so it goes faster. In summer \( l \) increases resulting in increase in time period so the clock goes slower.

(b) When the car moves down hill, the decrease in gravitational potential energy is converted into work against force of friction between brake shoe and drum which appears as heat.

71. According to Wein's displacement law, \( \lambda_{mt} = \text{Constant} \)

\[ \lambda_1 < \lambda_3 < \lambda_2 \]

\[ T_1 > T_3 > T_2 \]

72. The melting point of ice as well as the boiling point of water changes with change in pressure. The presence of impurities also changes the melting and boiling points. However the triple point of water has a unique temperature and is independent of external factors. It is that temperatures at which water, ice & water vapour co-exist that is 273.16K and pressure 0.46 cm of Hg.

**ANSWERS FOR SHORT QUESTIONS (3 MARKS)**

73. The ultimate stress should not exceed elastic limit of steel (30 \( \times \) \( 10^7 \) N/m\(^2\))
\[ U = \frac{F}{A} = \frac{Mg}{\pi r^2} = \frac{10^5 \times 9.8}{\pi r^2} = 30 \times 10^7 \]

\[ r = 3.2 \text{ cm} \]

So to lift a bad of \(10^4\) kg, crane is designed to withstand \(10^5\) kg. To impart flexibility the rope is made of large number of thin wires braided.

74. (a) Wire with larger plastic region is more ductile material A

(b) Young's modulus is \[
\frac{\text{Stress}}{\text{Strain}}
\]

\[ Y_A > Y_B \]

(c) For given strain, larger stress is required for A than that for B.

\[ A \text{ is stronger than } B. \]

(d) Material with smaller plastic region is more brittle, therefore B is more brittle than A.

76. (i) In case (a) Pressure head, \(h = + 20\) cm of Hg

Absolute pressure = \(P + h = 76 + 20 = 96\) cm of Hg.

Gauge Pressure = \(h = 20\) cm of Hg.

In case (b) Pressure Head \(h = -18\) cm of Hg

Absolute Pressure = \(76 - 18 = 58\) cm of Hg

Gauge Pressure = \(h = -18\) cm of Hg

77. as \(h, p, g = h_2, p_2, g\)

\[ h_1 \times 13.6 \times g = 13.6 \times 1 \times g \]

\[ h_1 = 1 \text{ cm} \]

Therefore as 13.6 cm of \(H_2O\) is poured in right limb it will displace Hg level by 1 cm in the left limb, so that difference of levels in the two limbs will become 19 cm.
79. \[ v = \frac{2}{9} \left[ g \left( \sigma - \rho \right) r^2 \right] \Rightarrow \frac{v}{r^2} = \frac{2g}{9\eta} \left( \sigma - \rho \right) \]  

Similarly, \[ \frac{v'}{R^2} = \frac{2g}{9\eta} \left( \sigma - \rho \right) \]  

Dividing 1 by 2

\[ \frac{v}{v'} = \frac{r^2}{R^2} \Rightarrow v' = v \left( \frac{R}{r} \right)^2 \]

If N drops coalesce, then

Volume of one big drop = volume of N droplets

\[ \frac{4}{3}\pi R^3 = N \left( \frac{4}{3}\pi r^3 \right) \]

\[ R = N^{1/3}r \]

∴ Terminal velocity of bigger drop = \( \left( \frac{R}{r} \right)^2 \times v \) from eq.(1)

= \( N^{2/3} v \) from eq. (2)

80. Let \( P_1 \) & \( P_2 \) be the pressures inside the two bubbles then

\[ P_1 - P = \frac{4T}{r_1} \Rightarrow P_1 = P + \frac{4T}{r_1} \]

\[ P_2 - P = \frac{4T}{r_2} \Rightarrow P_2 = P + \frac{4T}{r_2} \]

When bubbles coalesce

\[ P_1V_1 + P_2V_2 = PV \]  

(1)

∴ The pressure inside the new bubble \( p = P + \frac{4T}{r} \)
substituting for \( P \) & \( V_1 \) in eq.(1)

\[
\left( \frac{P + \frac{4T}{r_1}}{3} \right)^4 r_1^3 + \left( \frac{P + \frac{4T}{r_2}}{3} \right)^4 r_2^3 = \left( \frac{P + \frac{4T}{r}}{3} \right)^4 r^3
\]

or

\[
\frac{4}{3} \pi P \left( r_1^2 + r_2^2 - r^2 \right) + \frac{16 \pi T}{3} \left[ r_1^2 + r_2^2 - r^2 \right] = 0
\]

Given change in volume.

\[
V = \frac{4}{3} \pi r_1^3 + \frac{4}{3} \pi r_2^3 - \frac{4}{3} \pi r^3
\]

(3)

Change in Area

\[
4 \pi r_1^2 + 4 \pi r_2^2 - 4 \pi r^2
\]

(4)

Using eq. (3) & (4) in (2) we get:

\[
PV + \frac{4T}{3} A = 3 PV + 4 TA = 0
\]

82. Free block diagram of balloon and block shown below:

![Free block diagram of balloon and block](image)

When the balloon is held stationary in air, the forces acting on it get balance

Up thrust = Wt. of Balloon + Tension in string

\[ U = Mg + T \]

M For the small block of mass \( \frac{M}{2} \) floating stationary in air
\[ T = \frac{M}{2}g \]

\[ U = Mg + \frac{M}{2}g = \frac{3}{2}Mg \]

When the string is cut \( T = 0 \), the small block begins to fall freely, the balloon rises up with an acceleration ‘a’ such that

\[ U - Mg = Ma \]

\[ \frac{3}{2}Mg - Mg = Ma \]

\[ a = \frac{g}{2} \] in the upward direction.

83. (i) As the two vessels have liquid to same height and the vessels have same base area, the force exerted = pressure x base area will be same as pressure = \( h p g \).

(ii) Since the volume of water in vessel 1 is greater than in vessel (2), the weight of water = volume x density x \( h \), so weight of first vessel will be greater than the water in second vessel.

84. Radius of larger drop = \( \frac{D}{2} \)

radius of each small drop = \( r \)

\[ 27 \times \frac{4}{3} \pi r^3 = \frac{4}{3} \pi \left( \frac{D}{2} \right)^2 \Rightarrow r = \frac{D}{6} \]

Initial surface area of large drop \( 4\pi \left( \frac{D}{2} \right)^2 = \pi D^2 \)

Final surface area of 27 small drop = \( 27 \times 4\pi r^2 = 27 \times 4\pi \frac{D^2}{36} = 3\pi D^2 \)

\[ \therefore \text{ Change in energy} = \text{Increase in area} \times \sigma \]

\[ = 2\pi D^2 \sigma \]
87. \[ l_1' = l_1 [1 + \alpha_1(t_2 - t_1)] \]
\[ l_2' = l_1' [1 + \alpha_2(t_2 - t_1)] \]

Given that the difference in their length remain constant
\[ l_2' - l_1' = l_2 - l_1 \]
\[ l_2[1 + \alpha_2(t_2 - t_1)] - l_1[1 + \alpha_1(t_2 - t_1)] = l_2 - l_1 \]
\[ \therefore \alpha_2 = \alpha_1 \]

90. Here \( l = 1.8 \text{ m}, \ t_1 = 27^\circ \text{C}, \ t_2 = -39^\circ \text{C} \)
\[ r = \frac{2.0}{2} = 1.0 \text{ mm} = 1.0 \times 10^{-3} \text{ m} \]
\[ r = 2.0 \times 10^{-5} \text{ } \circ \text{C}^{-1}, \ Y = 0.91 \times 10^{11} \text{ Pa} \]

As \( \Delta l = l \alpha(t_2 - t_1) \) \( \therefore \) Strain, \( \frac{\Delta l}{l} = \alpha(t_2 - t_1) \)

Stress = Strain \times \text{Young’s modulus} = \alpha(t_2 - t_1) \times Y
\[ = 2.0 \times 10^{-5} \times (-39 - 27) \times 0.91 \times 10^{11} = 1.2 \times 10^8 \text{ Nm}^{-2} \]
[Numerically]

Tension developed in the wire = Stress \times \text{Area of cross-section}
\[ = \text{Stress} \times \pi r^2 = 1.2 \times 10^8 \times 3.14 \times (1.0 \times 10^{-3})^2 = 3.77 \times 10^2 \text{ N}. \]

96. Definition of coefficient of thermal conductivity.

In steady state the heat passing in unit time through the rod remain same that is
\[ \frac{Q}{t} = \frac{K_1A(T_1 - T)}{d_1} = \frac{K_2A(T - T_2)}{d_2} = \frac{KA(T_1 - T_2)}{d_1 + d_2} \]

where \( k \) is the coefficient of thermal conductivity
Also \( T_1 - T_2 = (T_1 - T) + (T - T_2) \)

\[
\therefore \frac{d_1 + d_2}{kA} = \frac{d_1}{K_1A} + \frac{d_2}{K_2A}
\]

\[
\therefore \frac{d_1 + d_2}{kA} = \frac{d_1}{K_1} + \frac{d_2}{K_2} = \frac{K_2d_1 + K_1d_2}{K_1K_2}
\]

\[
\therefore K = \frac{K_1K_2(d_1 + d_2)}{K_2d_1 + K_1d_2}
\]

**ANSWERS FOR NUMERICALS**

106. (a) Stress = \( \frac{F}{A} = \frac{mg}{\pi r^2} = \frac{40 \times 10}{\pi (1 \times 10^{-3})^2} = 1.27 \times 10^8 \text{N/m}^2 \)

(b) \( \Delta L = \frac{FL}{AY} = \frac{40 \times 10 \times 1}{\pi \times (1 \times 10^{-3})^2 \times 7 \times 10^{15}} = 1.8 \times 10^{-3} \text{m} \)

(c) Strain = \( \frac{\Delta L}{L} = \frac{1.8 \times 10^{-3}}{1} = 1.8 \times 10^{-3} \)

(d) \( F = Kx = K\Delta L, \) \( K = \) Force constant

\( K = \frac{\Delta F}{L} = \frac{40 \times 10}{1.8 \times 10^{-3}} = 2.2 \times 10^8 \text{N/m} \)

107. Pressure exerted at the bottom layer by water column of height \( h \) is

\( P = h \rho g = 2500 \times 1000 \times 10 \)

\( = 2.5 \times 10^7 \text{ N m}^{-2} \)

\( = \) Stress

Bulk modulus \( K = \frac{\text{Stress}}{\text{Strain}} = \frac{P}{\Delta V/V} \)

\[\text{Class XI : Physics}\]
\[
\frac{\Delta V}{V} = \frac{P}{K} = \frac{2.5 \times 10^7}{2.3 \times 10^9} = 1.08 \times 10^{-2}
\]

\[
= 1.08\%
\]

108. Area A of the upper face = \((0.30)^2\) m²

The displacement \(\Delta x\) of the upper face relative to the lower one is given by

\[
\Delta x = \frac{yF}{\eta A} \therefore \eta = \frac{F/A}{\Delta x/y}
\]

\[
\frac{0.30 \times 5 \times 10^3}{8.3 \times 10^6 \times (0.30)^2} = 2 \times 10^{-7} \text{m}
\]

\[
\therefore \text{Angle of shear } \alpha \text{ is given by } \tan \alpha = \frac{\Delta x}{y}
\]

\[
\alpha = \tan^{-1} \left( \frac{\Delta x}{y} \right)
\]

\[
= \tan^{-1} \left( \frac{2 \times 10^{-7}}{0.30} \right) = \tan^{-1} (0.67 \times 10^{-6})
\]

109. \(V = 1\) litre = \(10^{-3}\) m³

\[
\frac{\Delta V}{V} = 0.10\% = 0.10 \frac{100}{100} = 0.001
\]
\[ K = \frac{P}{\Delta V/V} \Rightarrow P = \frac{K\Delta V}{V} = 2.2 \times 10^9 \times 0.001 \]

\[ P = 2.2 \times 10^6 \text{ N m}^{-2} \]

110. Pressure at a depth of 10m = \( h \rho g \)

\[ = 10 \times 1030 \times 10 = 1.03 \times 10^5 \text{ N/m}^2 \]

ATM. pressure = 1.01 \times 10^5 \text{ pa.}

Total pressure at a depth of 10 m = \( 1.03 \times 10^5 + 1.01 \times 10^5 \)

\[ = 2.04 \times 10^5 \text{ pa} \]

111. \[ \frac{F_1}{A_1} = \frac{F_2}{A_2} \]

\[ F_1 = F_2 \frac{A_1}{A_2} = F_2 \left(\frac{\pi r_1^2}{\pi r_2^2}\right) \]

\[ F_1 = 1350 \times 9.8 \left(\frac{5 \times 10^{-2}}{15 \times 10^{-2}}\right)^2 \]

\[ = 1470 \text{ N.} \]

112. (i) When man is lying \( P = \frac{F}{A} = \frac{80 \times 9.8}{0.6} = 1.307 \times 10^3 \text{N/m}^{-2} \)

(ii) When man is standing then \( A = 2 \times 80 \text{ cm}^2 = 160 \times 10^{-4} \text{ m}^2 \)

\( P = \frac{80 \times 9.8}{160 \times 10^{-4}} = 4.9 \times 10^4 \text{Nm}^{-2} \)

113. (a) Pressure Instructed by manual = \( P_g = 200\text{K Pa} \)

(b) Absolute Pressure = 101k Pa + 200 k Pa = 301 k Pa

(c) At mountain Peak \( \dot{P}^\prime \) is 10% less

\( \dot{P}^\prime = 90 \text{ k Pa} \)
If we assume absolute pressure in tyre does not change during driving then $P_g = P - g\bar{a} = 301 - 30 = 211 \text{ k Pa}$

So the tyre will read 211 k Pa, pressure.

114. Excess pressure in soap bubble $= p = \frac{4T}{r} = \left( \frac{4 \times 0.58}{6 \times 10^{-3}} \right)$

$= 387 \text{ N m}^{-2}$

115. $v_t = \frac{2}{9} \left[ \frac{g(\sigma - \rho)r^2}{\eta} \right]$  

$\eta = \frac{2}{9} \left[ \frac{9.8 \times (8.9 \times 10^3 - 1.5 \times 10^3)(2 \times 10^{-3})^2}{6 \times 10^{-2}} \right]$  

$= 1.08 \text{ kg m}^{-1} \text{ s}^{-1}$

116. From Torricelli theorem, velocity of efflux $\nu = \sqrt{2gh}$

$= \sqrt{2 \times 10 \times 0.2}$

$= 2 \text{ m/s}$

117. Surface energy per unit area is equal to surface tension.

$E = \text{ increase in surface area} \times \text{ ST}$

$= 4\pi(2^2 - 1^2) \times 2.5$

$= 4\pi \times 3 \times 25$

$= 1.02 \times 10^3 \text{ erg}$

118. $F = \eta A \frac{dv}{dy}$

$= 0.01 \times 0.20 \times \frac{0.1}{0.003} = 66.7 \times 10^{-3} \text{ N}$
119. Since $A_1v_1 = A_2v_2$

$$v_2 = \frac{2 \times 4 \times 10^{-4}}{2 \times 10^{-5}} = 4 \text{m/s}$$

Using Bernoulli’s Theorem

$$P_2 = P_1 + \frac{1}{2} \rho (v_1^2 - v_2^2) + \rho g (h_1 - h_2)$$

$$\therefore \quad v_2 > v_1$$

$$h_2 > h_1$$

$$= 3 \times 10^5 + \frac{1}{2} (1000) [(2)^2 - (4)^2] - 1000 \times 9.8 \times 8$$

$$= 2.16 \times 10^5 \text{ N/m}^2$$

120. The volume of liquid flowing in time $t$ through a capillary tube is given by

$$V = Qt = \frac{\pi Pr^4 t}{8 \eta l} = \frac{\pi \rho gr^4 t}{g \eta l}$$

$$\therefore \quad \text{For water, } V_1 = \frac{\pi \rho_1 gr^4 t_1}{g \eta_1}$$

For petrol, $V_2 = \frac{\pi \rho_2 gr^4 t_2}{g \eta_2}$

But $V_1 = V_2$

$$\therefore \quad \frac{\pi \rho_1 gr^4 t_1}{g \eta_1} = \frac{\pi \rho_2 gr^4 t_2}{g \eta_2}$$

or

$$\frac{t_1}{t_2} = \frac{\eta_1}{\eta_2} \times \frac{\rho_1}{\rho_2} = \frac{0.01}{0.02} \times \frac{0.8}{0.02} = 0.4$$

121. Breaking stress = Maximum stress that the wire can withstand

$$= 7.8 \times 10^9 \text{ Nm}^{-2}$$
When the wire is suspended vertically, it tends to break under its own weight.

Let its length be $l$ and cross-sectional area $A$.

Weight of wire = $mg = \text{volume} \times \text{density} \times g = Al\rho g$

Stress = \[
\frac{\text{Weight}}{A} = Al\rho g \div A = l\rho g
\]

For the wire not to break, $l\rho g$ = Breaking stress = $7.8 \times 10^9$ Nm$^{-2}$

\[
\therefore \ l = \frac{7.8 \times 10^9}{\rho g} = \frac{7.8 \times 10^9}{7.8 \times 10^3 \times 10} = 10^5 \text{ m.}
\]

122. By Wien’s Displacement Law

\[
\lambda_m T = \lambda'_m T'
\]

\[
\frac{T}{T'} = \frac{\lambda'_m}{\lambda_m} = \frac{4.8 \times 10^{-7}}{3.6 \times 10^{-7}}
\]

\[
= \frac{4}{3}
\]

123. $\frac{F - 32}{180} = \frac{T - 273}{100}$

$\frac{149 - 32}{180} = \frac{T - 273}{100} \Rightarrow \frac{117}{9} = T - 273$

$T = 286k$

124. $m_1c_1(\theta_1 - \theta) = m_2c_2(\theta - \theta_2)$

\[
\therefore \ c_2 = 1 \text{ cal/gm}^\circ\text{C}
\]

\[
\therefore \ 50 \times 0.6 \times (120 - \theta) = 1.6 \times 10^3 \times 1 \times (\theta - 25)
\]

$\theta = 26.8^\circ\text{C}$
125. \( d_2 = d_1 [1 + \alpha \Delta t] \)

\[
5.243 = 5.231[1 + 1.2 \times 10^{-5} (T - 30)]
\]

\[
\frac{5243}{5231} - 1 = 1.2 \times 10^{-5} (T - 300)
\]

\( T = 191 + 300 = 491 \text{k} = 218^\circ \text{C} \)

126. 

\( \text{ice at } 0^\circ \text{C} \rightarrow \text{water at } 0^\circ \text{C} \rightarrow \text{water at } 6^\circ \text{C} \)

\( m_1c_1 (80 - 6) = m_2L + m_2c_2(6 - 0) \)

\( 100 \times 1 \times 74 = 100L + 100 \times 1 \times 6 \)

\( L = (1 \times 74) - 6 \)

\( = 68 \text{ cal/g.} \)

127. Heat required to convert \( H_2O \) at \( 0^\circ \) to \( H_2O \) at \( 100^\circ = m_1c_1t \)

\( = 30 \times 4186 \times 100 \)

\( = 1255800 \text{J} \)

Heat required to convert \( H_2O \) at \( 100^\circ \text{C} \) to steam at \( 100^\circ \text{C} \) is \( = mL \)

\( = 3 \times 2.256 \times 10^6 \)

\( = 6768000 \text{J} \)

Total heat \( = 8023800 \text{J} \)

128. Thermal stress = \( Kx \) strain = \( \frac{K\Delta V}{V} \)

Now, \( \gamma = \frac{\Delta V}{V\Delta T} \) or \( \frac{\Delta V}{V} = \gamma\Delta T \)

Thermal stress = \( K\gamma\Delta T = 3K\alpha\Delta T \) \( [\therefore \gamma = 3\alpha] \)

\( = 3 \times 140 \times 10^9 \times 1.7 \times 10^{-5} \times 20 \)

\( = 1.428 \times 10^8 \text{ Nm}^2 \)
129. \[ \frac{\theta_1 - \theta_2}{n} = \alpha \left( \frac{\theta_1 + \theta_2}{2} \right) - \theta_0 \]

\[ \frac{94 - 86}{2} = k \left( \frac{94 + 86}{2} - 20 \right) \Rightarrow 4 = k \times 70 \quad \ldots \ldots 1 \]

\[ \frac{82 - 78}{t'} = k \left( \frac{82 + 78}{2} - 20 \right) \Rightarrow \frac{4}{t'} = k \times 60 \quad \ldots \ldots 2 \]

Dividing eq. (1) by eq (2)

\[ \frac{4}{t'} = \frac{k \times 70}{k \times 60} \quad t' = \frac{7}{6} = 1.16 \text{ min} \]

130. \[ E = \sigma T^4 \]

\[ T = \left( \frac{E}{\sigma} \right)^{\frac{1}{4}} = \left( \frac{2.835}{5.670 \times 10^{-8}} \right)^{\frac{1}{4}} = 84.92 \text{ k} \]

\[ = 85 \text{ k.} \]
UNIT 8

THERMAL PHYSICS

8.1 Kinetic Theory of Gases: Assumption

1. The molecules of a gas are identical, spherical and perfectly elastic point masses.

2. The volume of molecules is negligible in comparison to the volume of gas.

3. Molecules of a gas moves randomly in all direction.

4. The speed of gas molecules lie between zero and infinity.

5. Their collisions are perfectly elastic.

6. The number of collisions per unit volume in a gas remains constant.

7. No attractive or repulsive force acts between gas molecules.

8.2 Pressure of an Ideal Gas.

\[ P = \frac{1}{3} \rho v^2_{ms} \quad \text{or} \quad P = \frac{1}{3} \frac{mN}{V} v^2_{ms} \]

\[
\text{rms velocity of the gas molecule } v_{ms} = \sqrt{\frac{v_1^2 + v_2^2 + v_3^2 + v_4^2 + \ldots}{N}}
\]

Relation between pressure and kinetic energy

\[ \text{K.E. per unit volume } (E) = \frac{1}{2} \left( \frac{M}{V} \right) v^2_{ms} = \frac{1}{2} \rho v^2_{ms} \quad P = \frac{2}{3} E \]
8.3 Ideal Gas Equation

The equation which relates the pressure \( P \), volume \( V \) and temperature \( T \) of the given state of an ideal gas is known as gas equation.

<table>

(1) **Universal gas constant** \( (R) \): Dimension \([ML^2T^{-2}θ^{-1}]\)

Thus universal gas constant signifies the work done by (or on) a gas per mole per kelvin.

\[
\text{S.T.P value} : 8.31 \text{ Joule Mole} × \text{kelvin} = 1.98 \text{ cal mole} × \text{kelvin}
\]

(2) **Boltzman’s constant** \( (k) \): Dimension \([ML^2T^{-2}θ^{-1}]\)

\[
k = \frac{1}{38} × 10^{-23} \text{ Joule/kelvin}
\]

8.4 Various Speeds of Gas Molecules

1. **Root mean square speed** \( v_{rms} = \sqrt{\frac{3P}{ρ}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3kT}{m}} \)

2. **Most probable speed** \( v_{mp} = \sqrt{\frac{2P}{ρ}} = \sqrt{\frac{2RT}{M}} = \sqrt{\frac{2kT}{m}} \)

3. **Average speed** \( v_{av} = \sqrt{\frac{8P}{πρ}} = \sqrt{\frac{8RT}{πM}} = \sqrt{\frac{8kT}{πm}} \)

\( v_{rms} > v_{av} > v_{mp} \) (remembering trick) (RAM)
8.5 Kinetic Energy of Ideal Gas.

Molecules of ideal gases possess only translational motion. So they possess only translational kinetic energy.

<table>

</tr>
</tbody>
</table>

Here $m =$ mass of each molecule, $M =$ Molecular weight of gas and $N_A =$ Avogadro number $= 6.023 \times 10^{23}$.

8.6 Degree of Freedom

The total number of independent modes (ways) in which a system can possess energy is called the degree of freedom ($f$).

The degree of freedom are of three types:

(i) Translational degree of freedom

(ii) Rotational degree of freedom

(iii) Vibrational degree of freedom

General expression for degree of freedom

$f = 3N - R$, where $N =$ Number of independent particles, $R =$ Number of independent restriction

(1) Monoatomic gas: It can have 3 degrees of freedom (all translational)

(2) Diatomic gas: A diatomic molecule has 5 degree of freedom: 3 translational and 2 rotational.

(3) Triatomic gas (Non-linear): It has 6 degrees of freedom: 3 translational and 3 rotational.

</tbody>
</table>

- The above degrees of freedom are shown at room temperature. Further at high temperature the molecule will have an additional degrees of freedom, due to vibrational motion.

8.7 Law of Equipartition of Energy.

For any system in thermal equilibrium, the total energy is equally distributed among its various degree of freedom. And the energy associated with each molecule of the system per degree of freedom of the system is $\frac{1}{2}kT$.

8.8 Mean Free Path

The average distance travelled by a gas molecule is known as mean free path.

Let $\lambda_1$, $\lambda_2$, $\lambda_3$........ $\lambda_n$ be the distance travelled by a gas molecule during $n$ collisions respectively, then the mean free path of a gas molecule is given by

$$\lambda = \frac{\lambda_1 + \lambda_2 + \lambda_3 + \ldots + \lambda_n}{n}$$

$$\lambda_1 = \frac{1}{\sqrt{2}\pi nd^2};$$ where $d= $ Diameter of the molecule, $n = $ Number of molecules per unit volume.
8.9 Specific heat or Specific Heat Capacity.

(1) **Gram specific heat**: It is defined as the amount of heat required to raise the temperature of unit mass of the substance by unit degree. Gram specific heat \( c = \frac{\Delta Q}{m \Delta T} \)

(2) **Molar specific heat**: It is defined as the amount of heat required to raise the temperature of one gram mole of the substance by a unit degree, it is represented by capital \( (C) \)

\[ C = \frac{Q}{\mu \Delta T} \]

\[ C = Mc = \frac{1}{\mu} \frac{\Delta Q}{\Delta T} \quad \text{[As} \mu = \frac{m}{M}] \]

8.10 Specific Heat of Gases

(i) In adiabatic process *i.e. \( \Delta Q=0 \),

\[ C = \frac{\Delta Q}{m(\Delta T)} = 0 \quad \text{i.e.} \quad C = 0 \]

(ii) In isothermal process *i.e. \( \Delta T= 0 \)

\[ C = \frac{\Delta Q}{m(\Delta T)} = \frac{\Delta Q}{0} = \infty \quad \text{i.e.,} \quad C = \infty \]

Specific heat of gas can have any positive value ranging from zero to infinity. Further it can even be negative Out of many values of specific heat of a gas, two are of special significance.

(1) **Specific heat of a gas at constant volume \( (c_v) \)**: It is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1 K when its volume is kept constant.

(2) **Specific heat of a gas at constant pressure \( (c_p) \)**: It is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1 K when its pressure is kept constant.
8.11 Mayer’s Formula

\[ C_p - C_v = R \]

This relation is called Mayer's formula and shows that \( C_p > C_v \), i.e. molar specific heat at constant pressure is greater than that at constant volume.

8.12 Specific Heat in Terms of Degree of Freedom

</tbody>
</table>
8.13 Heat

The energy associated with configuration and random motion of the atoms and molecules within a body is called heat.

1. Units: Joule (S.I.) and calorie (Practical unit)

2. The ratio of work done (W) to heat produced (Q) is constant.

\[ \frac{W}{Q} = J \text{ or } W = JQ \]

J is called mechanical equivalent of heat and has value 4.2 J cal.

1 calorie = 4.186 Joule – 4.12 Joule

3. Heat is a path dependent and is taken to be positive if the system absorbs it and negative if releases it.

8.14 Temperature.

Temperature is defined as the degree of hotness or coldness of a body. Heat flows from higher temperature to lower temperature.

Two bodies are said to be in thermal equilibrium when both the bodies are at the same temperature. Temperature \( T \propto \) kinetic energy \( \left[ \frac{3}{2}RT \right] \)

8.15 Scales of Temperature

The Kelvin temperature scale is also known as thermodynamic scale. The S.I. unit of temperature is kelvin and is defined as \((1/273.16)\) of the temperature of the triple point of water. The triple point of water is that point on a \( P-T \) diagram where the three phases of water, the solid, the liquid and the gas, can coexist in equilibrium.

To construct a scale of temperature, two fixed points are taken. First is the freezing point of water, it is called lower fixed point. The second is the boiling point of water, it is called upper fixed point.
<table>
<thead>
<tr>
<th>Name of the scale</th>
<th>Symbol for each degree</th>

</tr>
</tbody>
</table>

Temperature on one scale can be converted into other scale by using the following identity.

\[
\text{Reading on any scale - Lower fixed point (LFP) - Constant for all scales}
\]

Upper fixed point (UFP) - Lower fixed point (LFP)

8.16 Thermal Expansion.

When matter is heated, it expands.

(i) Coefficient of linear expansion \( \alpha = \frac{\Delta L}{L} \times \frac{1}{\Delta T} \)

(ii) Coefficient of superficial expansion \( \beta = \frac{\Delta A}{A} \times \frac{1}{\Delta T} \)

(iii) Coefficient of volume expansion \( \gamma = \frac{\Delta V}{V} \times \frac{1}{\Delta T} \)

(iv) The value of \( \alpha, \beta \) and \( \gamma \) depends upon the nature of material. All have dimension \([0^{-1}]\) and unit per \( ^\circ \text{C} \).

(v) \( \Delta L = L\alpha \Delta T, \Delta A = A\beta \Delta T \) and \( \Delta V = V\gamma \Delta T \)

(vi) Final length \( L' = L + \Delta L = L(1 + \alpha \Delta T) \)

Final area \( A' = A + \Delta A = A(1 + \beta \Delta T) \)

Final volume \( V' = V + \Delta V = V(1 + \gamma \Delta T) \)

(vii) \( \beta = 2\alpha \) and \( \gamma = 3\alpha \)
8.17 Anomalous Expansion of Water.

1. In case of water, it expands on heating if its temperature is greater than 4°C. In the range 0°C to water contracts on heating and expands on cooling, i.e. negative.

2. At 4°C, density of water is maximum while its specific volume is minimum.

8.18 Expansion of Gases.

Gases have no definite shape, therefore gases have only volume expansion.

8.19 Thermal Capacity and Water Equivalent

1. **Thermal capacity** - It is defined as the amount of heat required to raise the temperature of the whole body (mass m) through 0°C or 1 K.

   \[ \text{Thermal capacity} = m \ c = \mu C = \frac{Q}{\Delta T} \]

   Dimension: \([ML^2T^{-2}θ^{-1}]\), Unit: call °C (practical) Joule k (S.I.)

2. **Water Equivalent**: Water equivalent of a body is defined as the mass of water which would absorb or evolve the same amount of heat as is done by the body in rising or falling through the same range of temperature. It is represented by \(W\).

   If \(m = \text{Mass of the body, } c = \text{Specific heat of body}\)

   \[\therefore \text{Water equivalent } (W) = mc gm\]

8.20 Specific Heat.

1. **Gram specific heat**: The heat required to raise the temperature of unit mass of a body through 1°C (or K) is called specific heat of the material of the body.

   \[ \text{Specific heat } c = \frac{Q}{m\Delta T} \]

   Units: Calorie gm × °C (practical), J/kg × K (S.I.)

   Dimension: \([L^2T^{-2}θ^{-1}]\)
(2) **Molar specific heat**: Amount of heat required to raise the temperature of one gram mole of the substance through a unit degree it is represented by (capital) \( C \).

\[
C = \frac{Q}{\mu \Delta T}
\]

Units: calorie 'mole \times °C (practical); J mole \times kelvin (S.I.)

Dimension: \([ML^2T^{-2}θ^{-1}μ^{-1}]\)

8.21 Specific Heat of Solids

Specific heat of a solid is specific heat at constant volume \( C_v \).

With rise in temperature, \( C_v \) increases and becomes constant = 3\( R \)

**Dulong and Petit law** - Average molar specific heat of all metals at room temperature is constant and is equal to 3\( R \) This statement is known as Dulong and Petit law.

8.22 Latent Heat

(1) When a substance changes from one state to another state then energy is either absorbed or liberated. This heat energy is called latent heat.

(2) No change in temperature is involved when the substance changes its state.

(3) \( \Delta Q = mL \), where \( L \) is the latent heat.

(4) Unit: cal/gm or J kg and Dimension: \([L^2T^{-2}]\)

(5) Any material has two types of latent heats

   (i) **Latent heat of fusion**: The heat required to change 1 kg of the material in its solid state to its liquid state, latent heat of fusion (or latent heat of ice) is \( L_F = L_{ice} \approx 80 \) cal/g.
(ii) *Latent heat of vaporisation*: The heat energy required to change 1 kg of the material in its liquid state to 1 kg of the material in its gaseous state. Latent heat of vaporisation (latent heat of steam) is \( L_v = L_{\text{steam}} \approx 540 \text{ cal/gm}. \)

### 8.23 Principle of Caloriemetry

Heat lost = Heat gained

*i.e.* principle of caloriemetry represents the law of conservation of heat energy.

### 8.24 Heating Curve

#### Thermodynamic Processes

1. **Thermodynamics**: It is a branch of science which deals with exchange of heat energy between bodies and conversion of the heat energy into mechanical energy and vice versa.

2. **Thermodynamic system**: A collection of an extremely large number of atoms or molecules confined with in certain boundaries such that it has a certain value of pressure, volume and temperature is called a thermodynamic system. Anything outside the thermodynamic system to which energy or matter is exchanged is called its surroundings.

Thermodynamic system may be of three types:

   (i) **Open system**: It exchange both energy and matter with the surrounding.
   
   (ii) **Closed system**: It exchange only energy (not matter) with the surroundings.
   
   (iii) **Isolated system**: It exchange neither energy nor matter with the surrounding.

3. **Thermodynamic variables and equation of state**: Pressure, volume, temperature, internal energy and the number of moles are called thermodynamic variables.

   For \( \mu \) moles of an ideal gas, equation of state is \( PV = \mu RT \).
8.25 Zeroth Law of Thermodynamics

If systems $A$ and $B$ are each in thermal equilibrium with a third system $C$, then $A$ and $B$ are in thermal equilibrium with each other.

The zeroth law leads to the concept of temperature.

8.26 Quantities Involved in First Law of Thermodynamics

1) **Heat ($\Delta Q$)**: It is the energy that is transferred between a system and its environment.
   
   (i) Heat is a form of energy so it is a scalar quantity with dimension $[ML^2T^{-2}]$.
   
   (ii) Unit: Joule (S.I.), Calorie (1 calorie = 4.2 Joule)
   
   (iii) Heat is a path dependent quantity.
   
   (iv) $\Delta Q = mL$ [For change in state] and $\Delta Q = mc\Delta T$ [For change in temperature]

   $\langle \Delta Q \rangle_v = \mu C_v \Delta T$ [For constant volume] and $\langle \Delta Q \rangle_p = \mu C_p \Delta T$ [For constant pressure]

2) **Work ($\Delta W$)**:

   :. work done $\Delta W = \int_{V_i}^{V_f} pdV = P(V_f - V_i)$

   (i) Like heat, work is also a path dependent, scalar physical quantity with dimension $[ML^2T^{-2}]$

   (ii) $\Delta W = $ positive if $V_f > V_i$ i.e. system expands

   $\Delta W = $ negative if $V_f < V_i$ i.e. system contracts

   (iii) $W =$ area under $P-V$ diagram

   It is positive if volume increases (for expansion)

   It is negative if volume decreases (for compression)
It is positive if the cycle is clockwise.

It is negative if the cycle is anticlockwise.

(3) **Internal energy** \((U)\): Internal energy of a system is the energy due to molecular motion and molecular configuration.

The energy due to molecular motion is called internal kinetic energy \(U_K\) and that due to molecular configuration is called internal potential energy \(U_p\).

\[ U = U_K + U_p \]

\(i.e.\) Total internal energy \(U = U_K + U_p\)

(i) internal energy of an ideal gas is totally kinetic \(U = U_K = \frac{3}{2} \mu RT\)

(ii) In case of gases whatever be the process

\[ \Delta U = \mu \frac{f^T}{2} R \Delta t = \frac{\mu R (T_f - T_i)}{\gamma - 1} \frac{(P_f V_f - P_i V_i)}{\gamma - 1} \]

(iii) Change in internal energy does not depends on the path.

\[ \Delta U = U_f - U_i \]

(iv) Change in internal energy in a cyclic process is always zero.

**8.27 First Law of Thermodynamics**

It is a statement of conservation of energy. According to it \(\Delta Q = \Delta U + \Delta W\)

(1) **First law introduces the concept of internal energy.**

(2) **Sien conventions**
<table>
<thead>
<tr>
<th>$\Delta Q$</th>
<th>Positive</th>
<th>When heat is supplied to a system</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Negative</td>
<td>When heat is drawn from the system</td>
</tr>
<tr>
<td>$\Delta W$</td>
<td>Positive</td>
<td>When work done by the gas (expansion)</td>
</tr>
<tr>
<td></td>
<td>Negative</td>
<td>When work done on the gas (compression)</td>
</tr>
<tr>
<td>$\Delta U$</td>
<td>Positive</td>
<td>When temperature increases, internal energy increases</td>
</tr>
<tr>
<td></td>
<td>Negative</td>
<td>When temperature decreases, internal energy decreases</td>
</tr>
</tbody>
</table>

(3) **Limitation:** First law of thermodynamics does not indicate the direction of heat transfer. It does not tell anything about the conditions, under which heat can be transformed into work and also it does not indicate as to why the whole of heat energy cannot be converted into mechanical work continuously.

8.28 Isothermal Process.

In this process, $P$ and $V$ change but $T=\text{constant}$ *i.e.* change in temperature $\Delta T=0$

(1) **Condition for isothermal process**
   
   (i) The walls of the container must be perfectly conducting.
   
   (ii) The speed of process should be so slow.

(2) **Equation of state** - In all isothermal process Boyle’s law is obeyed. Hence equation of state is $PV=\text{constant}$.

(3) **Example of isothermal process**
   
   (i) Melting process [Ice melts at constant temperature 0°C]
   
   (ii) Boiling process [water boils at constant temperature 100°C].

(4) **Indicator diagram**

---

[Class XI : Physics] 228
(5) **Work done** \( W = \mu RT \log_e \left( \frac{V_i}{V_f} \right) \approx 2.303 \mu RT \log_{10} \left( \frac{V_i}{V_f} \right) \)

\[
W = \mu RT \log_e \left( \frac{P_i}{P_f} \right) = 2.303 \mu RT \log_{10} \left( \frac{P_i}{P_f} \right)
\]

(6) **Heat supplied in isothermal process** - \( \Delta Q = \Delta W \) i.e. heat supplied is used to do work against external surrounding.

8.29 **Adiabatic Process**

In this process \( P, V \) and \( T \) changes but \( \Delta Q = 0 \).

(1) **Essential conditions for adiabatic process**

   (i) All walls of the container and the piston must be perfectly insulating.

   (ii) The speed of process should be fast.

(2) **Example of some adiabatic process**

   (i) Sudden bursting of the tube of bicycle tyre.

   (ii) Propagation of sound waves in air and other gases.

(3) **Energy in adiabatic process**: For adiabatic process

\[
\Delta Q = 0 \quad \therefore \quad \Delta U + \Delta W = 0
\]

If \( \Delta W = \text{positive} \) then \( \Delta U = \text{negative} \) i.e. adiabatic expansion produce cooling.

If \( \Delta W = \text{negative} \) then \( \Delta U = \text{positive} \) i.e. adiabatic compression produce heating.

(4) **Equation of state**:

\[ PV^p = \text{constant} \]

It can also be re-written as

\[ TV^{y-1} = \text{constant} \]

and \( \frac{T^y}{P^{y-1}} = \text{constant} \)
(5) **Indicator diagram**

(i) Curve obtained on $PV$ graph are called adiabatic curve.

(ii) Slope of adiabatic curve $\tan \phi = -\gamma \left( \frac{P}{V} \right)$

(6) **Work done** :

$$w = \frac{PV_i - PV_f}{(\gamma - 1)} = \mu R(T_f - T_i)$$

(7) **Free expansion** : Free expansion is adiabatic process in which no work is performed on or by the system. The final and initial energies are equal in free expansion.

### 8.30 Reversible and Irreversible Process

(I) **Reversible process** : A reversible process is one which can be reversed in such a way that all changes occurring in the direct process are exactly repeated in the opposite order and inverse sense. The conditions for reversibility are:

(i) There must be complete absence of dissipative forces. (friction, viscosity etc.)

(ii) The speed of process should be infinitely slowly.

(iii) The temperature of the system must not differ appreciably from its surroundings.

Examples of reversible process are:

(a) All slow isothermal and adiabatic changes are reversible.

(b) Very slow evaporation or condensation.

(2) **Irreversible process** : Any process which is not reversible exactly is an irreversible process. Examples of irreversible processes are:
(i) Sudden expansion or contraction
(ii) Heat transfer between bodies

8.31 Cyclic and Non-cyclic Process

A cyclic process consists of a series of changes which return the system back to its initial state.

In non-cyclic process the series of changes involved do not return the system back to its initial state.

(1) In cyclic process change in internal energy is zero and temperature of system remains constant.

(2) Heat supplied is equal to the work done by the system.

(3) For cyclic process $P-V$ graph is a closed curve and area enclosed by the closed path represents the work done.

If the cycle is clockwise work done is positive and if the cycle is anticlockwise work done is negative.

8.32 Graphical Representation of Various Processes

Heat engine is a device which converts heat into work continuously through a cyclic process.

The essential parts of a heat engine are:

Source: Working substance: Steam, petrol etc.
Sink : “efficiency” $\eta$ is given by

$$\eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{w}{Q_1}$$

also $\eta = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{Q_2}{Q_1}$

A perfect heat engine $\eta = 1$. Practically efficiency is always less than 1.

8.33 Refrigerator or Heat Pump.

A refrigerator or heat pump is basically a heat engine run in reverse direction.

It essentially consists of three same parts.

The performance of a refrigerator is expressed by means of “coefficient of performance” $\beta$ which is defined as the ratio of the heat extracted from the cold body to the work needed to transfer it to the hot body.

$$i.e \beta = \frac{\text{Heat extracted}}{\text{work done}} = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$$

A perfect refrigerator

$W = 0$ so that $Q_1 = Q_2$ and hence $\beta = \infty$

1) Carnot refrigerator -

For Carnot refrigerator $= \frac{Q_1}{Q_2} = \frac{T_1}{T_2}$

coefficient of performance $\beta = \frac{T_2}{T_1 - T_2}$

where $T_1 = $ temperature of surrounding, $T_2 = $ temperature of cold body
(2) **Relation between coefficient of performance and efficiency of refrigerator**

\[ \beta = \frac{1 - \eta}{\eta} \]

8.34 Second Law of Thermodynamics

(1) **Clausius statement**: It is impossible for a self acting machine to transfer heat from a colder body to a hotter one without the aid of an external agency.

(2) **Kelvin’s statement**: It is impossible for a body or system to perform continuous work by cooling it to a temperature lower than the temperature of the coldest one of its surroundings.

(3) **Kelvin-Planck’s statement**: It is impossible to design an engine that extracts heat and fully utilises into work without producing any other effect.

8.35 Carnot Engine

Carnot designed a theoretical engine. This engine cannot be realised in actual practice.

(1) **Carnot cycle**: The working substance of the engine undergoes a cycle known as Carnot cycle. It consists of the following four strokes:

- (i) Isothermal expansion:
- (ii) Adiabatic expansion:
- (iii) Isothermal compression:
- (iv) Adiabatic compression:

(2) **Efficiency of Carnot cycle**:

\[ \eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{W}{Q_1} \]

\[ \eta = 1 - \frac{T_2}{T_1} \]

(i) Efficiency of a heat engine depends only on temperatures.
(ii) Efficiency of a heat engine is always lesser than unity, i.e., whole of heat can never be converted into work which is in accordance with second law.

(3) **Carnot theorem**: Carnot’s reversible engine working between two given temperatures is considered to be the most efficient engine.

**TRANSMISSION OF HEAT**

### 8.36 Introduction

The transfer of heat from one body to another may take place by one of the following modes.

<table>
<thead>
<tr>
<th>Conduction</th>
<th>Convection</th>
<th>Radiation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heat flows from hot end to cold end. Particles of the medium simply oscillate but do not leave their place.</td>
<td>Each particle absorbing heat is mobile</td>
<td>Heat flows without any intervening medium in the form of electromagnetic waves.</td>
</tr>
<tr>
<td>Medium is necessary for conduction</td>
<td>Medium is necessary for convection</td>
<td>Medium is not necessary for radiation</td>
</tr>
<tr>
<td>It is a slow process</td>
<td>It is also a slow process</td>
<td>It is a very fast process</td>
</tr>
<tr>
<td>Path of heat flow may be zig-zag</td>
<td>Path may be zig-zag or curved</td>
<td>Path is a straight line</td>
</tr>
<tr>
<td>Conduction takes place in solids</td>
<td>Convection takes place in fluids</td>
<td>Radiation takes place in gaseous and transparent media</td>
</tr>
<tr>
<td>The temperature of the medium increases through which heat flows</td>
<td>In this process also the temperature of medium increases</td>
<td>There is no change in the temperature of the medium</td>
</tr>
</tbody>
</table>

### 8.37 Conduction

(1) **Variable and steady state**: If temperature of every cross-section of the rod goes on increasing, hence rod is said to exist in variable state.

The state of the rod in which no part of rod absorbs heat is called steady state. (Temperature of every cross-section of the rod remains constant.)

(2) **Isothermal surface**: Any surface having its all points at the same temperature, is called isothermal surface.
(3) **Temperature Gradient**: The rate of change of temperature with distance between two isothermal surfaces is called temperature gradient.

Temperature gradient \( \frac{\theta - \Delta \theta}{\Delta x} = -\frac{\Delta \theta}{\Delta x} \)

The negative sign shows that temperature 0 decreases as the distance \( x \) increases in the direction of heat flow.

(4) **Coefficient of thermal conductivity**: If \( L \) be the length of the rod, \( A \) the area of cross-section and \( \theta_1 \) and \( \theta_2 \) are the temperature of its two faces, then the amount of heat flowing from one face to the other face in time \( t \) is given by

\[
Q = \frac{KA(\theta_1 - \theta_2)t}{l}
\]

Where \( K \) is coefficient of thermal conductivity of material of rod.

(i) Units: *Call cm sec °C (in C.G.S.)*, \( k \) *call m see K (in M.K.S.)* and \( W/m K \) (in S.I.)

(ii) Dimension: \([MLT^{-3}θ^{-1}]\)

(iii) The magnitude of \( K \) depends only on nature of the material.

(iv) For perfect conductors, \( K = \infty \) and for perfect insulators, \( K = 0 \)

(v) The thermal conductivity of pure metals decreases with rise in temperature but for alloys thermal conductivity increases with increase of temperature.

(viii) Human body is a bad conductor of heat.
8.38 Combination of Conductors

(1) **Series combination:** Let \( n \) slabs each of cross-sectional area \( A \) are connected in the series. Heat current is the same in all the conductors.

\[
\frac{Q}{t} = H_1 = H_2 = H_3 = \ldots = H_n
\]

\( i.e., \quad \frac{Q}{t} = H_1 = H_2 = H_3 = \ldots = H_n \)

(i) Equivalent resistance \( R = R_1 + R_2 + R_3 + \ldots \ldots \ldots R_n \)

(ii) If \( K_s \) is equivalent conductivity,

\[
\therefore K_s = \frac{l_1 + l_2 + l_3 + \ldots \ldots l_n}{K_1 + K_2 + K_3 + \ldots \ldots K_n}
\]

then

\[
\begin{align*}
\theta_1 & \quad \Theta_2 & \quad \Theta_3 & \quad \Theta_4 & \quad \Theta_{n-1} & \quad \Theta_n \\
K_1 & \quad K_2 & \quad K_3 & \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots K_n
\end{align*}
\]

(2) **Parallel Combination:** Let \( n \) slabs each of length/area connected in parallel then.

(i) Equivalent resistance \( \frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \ldots \ldots \frac{1}{R_n} \)

(ii) Temperature gradient across each slab will be same.

(iii) Heat current in each slab will be different.

\[
\therefore K = \frac{K_1 A_1 + K_2 A_2 + K_3 A_3 + \ldots \ldots K_n A_n}{A_1 + A_2 + A_3 + \ldots \ldots A_n}
\]

8.39 Convection

Mode of transfer of heat by means of migration of material particles of medium is called convection. It is of two types.

(1) **Natural convection:** This arise due to difference of densities at two places on account of gravity.
(2) **Forced convection**: If a fluid is forced to move then it is called forced convection. In this case *Newton's law of cooling* holds good. According to which rate of loss of heat from a hot body is directly proportional to the surface area of body and excess temperature of body over its surroundings

\[ \frac{Q}{t} \propto A(T - T_0) \]

where \( T = \) Temperature of body and \( T_0 = \) Temperature of surrounding

(i) Natural convection takes place from bottom to top while forced convection in any direction.

(ii) Natural convection is not possible in a gravity free region such as a free falling lift or an orbiting satellite.

8.40 Radiation

The process of the transfer of heat from one place to another place without heating the intervening medium is called radiation.

**Properties of thermal radiation**

1. Thermal radiations are also called infra-red radiations.

2. Medium is not required for the propagation of radiations.

3. Every body whose temperature is above zero Kelvin emits thermal radiation.

4. Their speed is equal to that of light.

5. They follow laws of reflection refraction, interference diffraction and polarisation

UNIT = 08 - THERMODYNAMICS

**QUESTIONS**

1. Why spark is produced when two substances are struck hard against each other?
2. What is the specific heat of a gas in an isothermal process.

3. On what factors, does the efficiency of Carnot engine depend?

4. What are two essential features of Carnot’s ideal heat engine.

5. Plot a graph between internal energy U and Temperature (T) of an ideal gas.

6. Refrigerator transfers heat from cold body to a hot body. Does this violate the second law of thermodynamics.

7. Is it possible to increase the temperature of gas without giving it heat?

8. Can the specific heat of a gas be infinity?

9. Out of the parameters: temperature, pressure, work and volume, which parameter does not characterise the thermodynamics state of matter?

10. Why a gas is cooled when expanded?

11. On what factors, the efficiency of a Carnot engine depends?

12. Heat is supplied to a system, but its internal energy does not increase. What is the process involved?

13. Under what ideal condition the efficiency of a Carnot engine be 100%.

14. Which thermodynamic variable is defined by the first law of thermodynamics?

15. If coefficient of performance of a refrigerator a constant quantity?

16. What is the efficiency of carnot engine working between ice point and steam point?

17. Heat cannot flow itself from a body at lower temperature to a body at higher temperature is a statement or consequence of which low of thermodynamics?

18. What is the specific heat of a gas in an adiabatic process.
SHORT ANSWER TYPE QUESTIONS (2 MARKS)

19. Heat system based on circulation of steam are more efficient in warning a building than those based on circulation of hot water why?

20. Write two limitation of the first law of thermodynamics.

21. Write the expressions for $C_v$ and $C_p$ of a gas in terms of gas constant $R$ and $\gamma$ where
   $\gamma = \frac{C_p}{C_v}$

22. No real engine can have an efficiency greater than that of a carnot engine working between the same two temperatures. Why?

23. Why water at the base of a waterfall is slightly warmer than at the top?

24. When ice melts, the change in internal energy is greater than the heat supplied. Why?

25. Give two statements for the second law of thermodynamics.

26. An ideal monatomic gas is taken round the cycle ABCDA as shown. Calculate the work done during the cycle.

27. Can a room be cooled by opening the door of refrigerator in a closed room?

28. Explain what is meant by isothermal and adiabatic operations.

29. Two bodies at different temperatures $T_1$ and $T_2$, if brought in thermal contact do not necessarily settle to the mean temperature $(T_1 + T_2)/2$ Explain?
SHORT ANSWER TYPE QUESTIONS (3 MARKS)

30. Obtain an expression for work done in an isothermal process.

31. Identify and name the Thermodynamic processes 1, 2, 3 as shown in figure.

32. Two samples of gas initially at the same temperature and pressure are compressed from volume V to V/2 one sample is compressed isothermally and the other adiabatically in which case the pressure will be higher? Explain?

33. Explain briefly the principle of a heat pump. What is meant by coefficient of performance?

34. (a) Why a gas has two principal specific heat capacities?
(b) Which one is greater and why?
(c) Of what significance is the difference between these two specific heat capacities and their ratio?

35. Is it a violation of the second law of thermodynamics to convert
(a) Work completely in to heat
(b) Heat completely in to work
Why or why not?

36. State first law of thermodynamics on its basis establish the relation between two molar specific heat for a gas.

37. Explain briefly the working principle of a refrigerator and obtain an expression for its coefficient of performance.
38. State zeroth law of thermodynamics. How does it lead to the concept of temperature?

39. What is a cyclic process? Show that the net work done during a cyclic process is numerically equal to the area of the loop representing the cycle.

40. State second law of thermodynamics.

41. What is an isothermal process? Derive an expression for work done during an isothermal process.

**LONG ANSWER TYPE QUESTIONS (5 MARKS)**

42. Describe briefly Carnot engine and obtain an expression for its efficiency.

43. Define adiabatic process. Derive an expression for work done during adiabatic process.

44. Why a gas has two principle specific heat capacities? What is the significance of \( C_p - C_v \) and \( C_p/C_v \) where symbols have usual meaning.

**NUMERICALS**

45. When a system is taken from state A to state B along the path ACB, 80 k cal of heat flows into the system and 30 kcal of work is done.

   (a) How much heat flows into the system along path ADB if the work done is 10 k cal?

   (b) When the system is returned from B to A along the curved path the work done is 20 k cal. Does the system absorb or liberate heat.

   (c) If \( U_A = 0 \) and \( U_D = 40 \) k cal, find the heat absorbed in the process AD

![Diagram of P-V cycle](image-url)
46. \( \frac{1}{2} \) mole of helium is contained in a container at S.T.P. How much heat energy is needed to double the pressure of the gas, keeping the volume constant? Heat capacity of gas is 3 J g\(^{-1}\) K\(^{-1}\).

47. A thermodynamic system is taken from an original state to an intermediate state by the linear process shown in Fig.

Its volume is then reduced to the original value from E to F by an isobaric process. Calculate the total work done by the gas from D to E to F.

![Diagram showing a thermodynamic process](image)

48. What is the coefficient of performance (\( \beta \)) of a carnot refrigerator working between 30°C and 0°C?

49. Calculate the fall in temperature when a gas initially at 72°C is expanded suddenly to eight times its original volume. (\( \gamma = \frac{5}{3} \))

50. Refrigerator is to maintain eatables kept inside at 9°C. If room temperature is 36°C calculate the coefficient of performance.

51. A perfect carnot engine utilizes an ideal gas the source temperature is 500K and sink temperature is 375K. If the engine takes 600k cal per cycle from the source, calculate
   
   (i) The efficiency of engine
   (ii) Work done per cycle
   (iii) Heat rejected to sink per cycle.

52. Two carnot engines A and B are operated in series. The first one A receives heat at 900 K and reject to a reservoir at temperature T K.
The second engine B receives the heat rejected by the first engine and in turn rejects to a heat reservoir at 400 K calculate the temperature $T$ when 

(i) The efficiencies of the two engines are equal 

(ii) The work output of the two engines are equal 

53. Ten mole of hydrogen at NTP is compressed adiabatically so that its temperature become 400°C How much work is done on the gas? What is the increase in the internal energy of the gas 

$$ R = 8.4 \text{ J mol}^{-1} \text{ K}^{-1} \gamma = 1.4 $$

54. The temperature $T_1$ and $T_2$ of the two heat reservoirs in an ideal carnot engine be 1500°C and 500°C respectively. which of these increasing $T_1$ by 100°C or decreasing $T_2$ by 100°C would result in a greater improvement in the efficiency of the engine.

**SHORT ANSWERS (1 MARK)**

1. Work is converted into heat. 
2. Infinite 
3. $\eta = 1 - T_2/T_1$ 
4. (i) Source and sink have infinite heat capacities. 
   (ii) Each process of the engine’s cycle is fully reversible 
5. 

   ![Graph](image)

   $U$ 

   $T(K)$ 

6. No, External work is done 
7. Yes, it happens during an adiabatic process.
8. Yes
10. Decrease in internal energy.
11. Temperatures of source of heat and sink.
12. Isothermal expansion.
13. If the temperature of sink is zero kelvin.
15. No. As the inside temperature of the refrigerator decreases, its coefficient of performance decreases.
16. \[ \eta = 1 - \frac{T_2}{T_1} = 1 - \frac{273}{373} = 26.8\% \]
17. Second law of thermodynamics.

**SHORT ANSWERS (2 MARKS)**

19. because steam at 100°C has more heat than water at 100°C.
20. (i) It does not give the direction of flow of heat.
   (ii) It does not explain why heat cannot be spontaneously converted into work.
21. \[ \gamma = \frac{C_p}{C_v} \]
    \[ C_p - C_v = R \]
    \[ C_p = \gamma C_v \]
    \[ (\gamma - 1)C_v = R; \ C_v = \frac{R}{\gamma - 1} \]
    \[ C_p = \frac{\gamma R}{\gamma - 1} \]
22. In Carnot engine.
   (i) There is absolutely no friction between the wall of cylinder and piston.
   (ii) Working substance is an ideal gas

In real engine these condition cannot be fulfilled.

23. Potential energy converted into kinetic energy, some part of kinetic energy is converted into heat.

24. \( dq = du + dw \)
   \( du = dq - pdv \)

26. PV

27. No, it violates second law.

28. Adiabatic process - Pressure, volume and temperature of the system changes but there is no exchange of heat.
   Isothermal process - Pressure, volume changes temperature remain constant.

29. Heat flows from higher temperature to lower temperature until the temperature become equal.

Two bodies

\[ m_1 = \text{mass of 'A'} \quad \begin{array}{c} \text{T}_1 \\ \text{c1} = \text{specific heat of A} \end{array} \quad \begin{array}{c} \text{T}_2 \\ \text{c2} = \text{specific heat of B} \end{array} \]

Let \( T_1 > T_2 \) Heat will be lost by 'A' and gained by 'B' According to principle of calorimetry,

Heat lost = Heat gained

Let their common temperature attained be \( T \),

\[ m_1 \text{c}_1 \text{T}_1 - m_1 \text{c}_1 \text{T} = m_2 \text{c}_2 \text{T} - m_2 \text{c}_2 \text{T}_2 \]

\[ m_1 \text{c}_1 \text{T}_1 + m_2 \text{c}_2 \text{T}_2 = (m_1 \text{c}_1 + m_2 \text{c}_2) \text{T} \]
\[ T = \frac{m_1 c_1 T_1 + m_2 c_2 T_2}{(m_1 c_1 + m_2 c_2)} \]

It is possible only,

If \( m_1 = m_2 = m \), \( C_1 = C_2 = C \),

\[ T = \frac{T_1 + T_2}{2}. \]

**ANSWERS**

45. (a) \( dw_{ADB} = +10 \text{ k cal} \)

Internal energy is path independent

\[ du_{ADB} = du_{ACB} = 50 \text{ k cal} \]

\[ dQ_{ADB} = 50 + 10 = 60 \text{ k cal}. \]

(b) \( dw_{BA} = -20 \text{ k cal} \)

\[ du_{BA} = -du_{ADB} \]

\[ dQ_{BA} = du_{BA} + dW_{BA} = -50 - 20 = -70 \text{ k cal} \]

(c) \( U_A = 0 \) \( U_D = 40 \text{ k cal} \)

\[ du_{AD} = 40 \text{ k cal} \]

\[ dw_{ADB} = 10 \text{ k cal} \]

\[ dw_{DB} = 0 \text{ since } dV = 0 \]

\[ dQ_{AD} = 40 + 10 = 50 \text{ k cal} \]

46. \( n = \frac{1}{2}, C_v = 3 \text{J/gK} \). \( M = 4 \)

\[ C_v = MC_v = 12 \text{ J/mole k} \text{ M} \rightarrow \text{Molecular mass} \]

\[ \frac{P_2}{P_1} = \frac{T_2}{T_1} = 2 \]
\[ \Delta T = 2T_1 - T_1 = 273 \text{ k} \]
\[ \Delta Q = n c_v \Delta T = 1638 \text{ J} \]

47. Total work done by the gas from D to E to F.

\[ W = W_{DE} + W_{EF} \]

\[ = \text{Area of trapezium DEGHD} - \text{Area of rectangle EFHG} \]

\[ = \text{Area of triangle DEF} \]

\[ = \frac{1}{2} DE \times FE \]

\[ = \frac{1}{2} (600 - 300) \text{ Nm}^{-2} \times (5.0 - 2.0) \text{ m}^3 \]

\[ = 450 \text{ J}. \]

48. \[ \beta = \frac{T_2}{T_1 - T_2} = \frac{273}{303 - 273} = 9.1 \]

49. \[ T_1 V_1^{\gamma-1} = T_2 V_2^{\gamma-1} \]

\[ T_2 = T_1 \left( \frac{V_1}{V_2} \right)^{\gamma-1} = 345 \left( \frac{\times}{8} \right)^{2/3} \]

\[ = 345 \times \frac{1}{4} = 86.25 \text{ k} \]

50. Here \( T_1 = 273 + 36 = 309 \text{ K} \),

\( T_2 = 273 + 9 = 282 \text{ K} \).

Coefficient of performance,

\[ \beta = \frac{T_2}{T_1 - T_2} = \frac{282}{309 - 282} = \frac{282}{27} = 10.4 \]

51. \( T_1 = 500 \text{ K} \), \( T_2 = 375 \text{ K} \)

\( Q_1 = \text{Heat absorbed} = 600 \text{ k cal} \)
\[ \eta = 1 - \frac{T_2}{T_1} = \frac{125}{500} = 0.25 \]

= 25%

(b) \[ \eta = \frac{W}{Q_i} \]

\[ W = \eta Q_1 = 0.25 \times 60 \text{ K cal} = 150 \text{ k cal} \]

= 450 k cal

(c) \[ w = Q_1 - Q_2 \]

\[ Q_2 = Q_1 - W = 600 - 150 \]

= 450 k cal

52. \[ W_A = W_B \]

\[ \frac{W}{Q_i} = \left( 1 - \frac{T_2}{T_1} \right) \]

\[ W = Q_1(1 - T_2/T_1) \]

\[ Q_2(1 - T_3/T_2) = Q_1(1 - T_2/T_1) \]

\[ (1 - T/900) Q_i = \left( 1 - \frac{400}{T} \right) Q_2 \]

\[ (1 - T/900) Q_i = \left( 1 - \frac{400}{T} \right) \frac{T}{900} \]

\[ 1 - T/900 = \frac{T}{900} = \frac{400}{900} \]

\[ \frac{2T}{900} = 13/9 \]

\[ T = 650 \text{ K} \]

\[ \eta_A = \eta_B \]

\[ 1 - T/900 = \frac{1 - 400}{T} \]
\[ T_2 = 900 \times 400 \]
\[ = 600 \text{ k} \]
\[ T_1 = 273 \text{ k} \quad T_2 = 673 \text{ k} \]

mass of gas = 10 mole

\[ W_{\text{adia}} = \frac{10R}{(\gamma - 1)} (T_1 - T_2) \]
\[ = \frac{10 \times 8.4}{(1.4 - 1)} (273-673) \]
\[ = -8.4 \times 10^4 \text{ J work being done on the gas} \]

\[ du = -dw = 8.4 \times 10^4 \text{ J} \]

54. \( \eta = 1 - \frac{T_2}{T_1} \)

(i) \( T_1 \) is increased from 1500°C to 1600°C

\[ T_1 = 1873 \text{ k} \]
\[ T_2 \text{ remain constant} \quad T_2 = 773 \text{ k} \]

\[ \eta_1 = \frac{1873 - 773}{1873} = 58.73\% \]

(ii) \( T_1 \) remain constant 1500°C

\[ T_1 = 1500 + 273 = 1773 \text{ k} \]
\[ T_2 \text{ is decreased by 100 i.e. 400°C} \]
\[ T_2 = 400 + 273 = 673 \text{ k} \]

\[ \eta_2 = \frac{1773 - 673}{1773} = \frac{1100}{1773} = 62.04\% \]

\( \eta_2 > \eta_1 \)
UNIT-9

KINETIC THEORY OF GASES

VERY SHORT ANSWER TYPE QUESTIONS (1 MARK)

1. Write two condition when real gases obey the ideal gas equation (PV = nRT). n → number of mole.

2. If the number of molecule in a container is doubled. What will be the effect on the rms speed of the molecules?

3. Draw the graph between P and 1/V (reciprocal of volume) for a prefect gas at constant temperature.

4. Name the factors on which the degree of freedom of gas depends.

5. What is the volume of a gas at absolute zero of temperature?

6. How much volume does one mole of a gas occupy at NTP?

7. What is an ideal gas?

8. The absolute temperature of a gas is increased 3 times what is the effect on the root mean square velocity of the molecules?

9. What is the Kinetic Energy per unit volume of a gas whose pressure is P?

10. A container has equal number of molecules of hydrogen and carbon dioxide. If a fine hole is made in the container, then which of the two gases shall leak out rapidly?

11. What is the mean translational Kinetic energy of a perfect gas molecule at temperature T?

12. Why it is not possible to increase the temperature of a gas while keeping its volume and pressure constant.
13. When an automobile travels for a long distance the air pressure in the tyres increases. Why?

14. A gas storage tank has a small leak. The pressure in the tank drop more quickly if the gas is hydrogen than if it is oxygen. Why?

15. Why the land has a higher temperature than the ocean during the day but a lower temperature at night.

16. Helium is a mixture of two isotopes having atomic masses 3g/mol and 4g/mol. In a sample of helium gas, which atoms move faster on average?

17. State Avogadro's law. Deduce it on the basis of Kinetic theory of gases.

18. Although the velocity of air molecules is nearly 0.5 km/s yet the smell of scent spreads at a much slower rate why.

19. The root mean square (rms) speed of oxygen molecule at certain temperature 'T' is 'V'. If temperature is doubled and oxygen gas dissociates into atomic oxygen what is the speed of atomic oxygen?

20. Two vessels of the same volume are filled with the same gas at the same temperature. If the pressure of the gas in these vessels be in the ratio 1 : 2 then state
   (i) The ratio of the rms speeds of the molecules.
   (ii) The ratio of the number of molecules.

21. Why gases at high pressure and low temperature show large deviation from ideal gas behaviour.

22. A gas is filled in a cylinder fitted with a piston at a definite temperature and pressure. Why the pressure of the gas decreases when the piston is pulled out.
SHORT ANSWER TYPE QUESTIONS (3 MARKS)

23. On what parameters does the $\lambda$ (mean free path) depends.

24. Equal masses of oxygen and helium gases are supplied equal amount of heat. Which gas will undergo a greater temperature rise and why?

25. Why evaporation causes cooling?

26. Two thermally insulated vessels 1 and 2 are filled, with air at temperatures $(T_1, T_2)$, volume $(V_1, V_2)$ at pressure $(P_1, P_2)$ respectively. If the value joining the two vessels is opened what is temperature of the vessel at equilibrium.

27. A partition divides a container having insulated walls into two compartments I and II. The same gas fills the two compartment. What is the ratio of the number of molecules in compartments I and II?

28. Prove that for a perfect gas having n degree of freedom

$$\frac{C_p}{C_v} = 1 + \frac{2}{n}$$

where $C_p$ and $C_v$ have their usual meaning.

29. The ratio of specific heat capacity at constant pressure to the specific heat capacity at constant volume of a diatomic gas decreases with increase in temperature. Explain.

30. Isothermal curves for a given mass of gas are shown at two different temperatures $T_1$ and $T_2$ state whether $T_1 > T_2$ or $T_2 > T_1$ justify your answer.
31. Three vessels of equal capacity have gases at the same temperature and pressure. The first vessel contains neon (monatomic) the second contains chlorine (diatomic) and the third contains uranium hexafluoride (polyatomic). Do the vessels contain equal number of respective molecules? Is the root mean square speed of molecules the same in the three cases? If not in which case is $V_{\text{rms}}$ the largest?

**LONG ANSWER TYPE QUESTIONS (5 MARKS)**

33. What are the basic assumptions of kinetic theory of gases? On their basis derive an expression for the pressure exerted by an ideal gas.

34. What is meant by mean free path of a gas molecule? Derive an expression for it.

35. Given that $P = \frac{1}{3} \rho c^2$ where $P$ is the pressure, $\rho$ is the density and $c$ is the rms. Velocity of gas molecules. Deduce Boyle’s law and Charles’ law of gases from it.

36. What do you understand by mean speed, root mean square speed and most probable speed of a gas. The velocities of ten particles in m/s are 0, 2, 3, 4, 4, 4, 5, 5, 6, 9 calculate.
(i) Average speed

(ii) r.m.s. speed

37. What is law of equipartition of energy? Find the value of \( \Upsilon = C_p/C_v \) for diatomic and monatomic gas. Where symbol have usual meaning.

**NUMERICALS**

38. An air bubble of volume 1.0 cm\(^3\) rises from the bottom of a lake 40 m deep at a temperature of 12°C. To what volume does it grow when it reaches the surface which is at a temperature of 35°C?

39. A vessel is filled with a gas at a pressure of 76 cm of mercury at a certain temperature. The mass of the gas is increased by 50% by introducing more gas in the vessel at the same temperature. Find out the resultant pressure of the gas.

40. One mole of a monoatomic gas is mixed with three moles of a diatomic gas. What is the molecular specific heat of the mixture at constant volume? Take \( R = 8.31 \text{/mol}\^{-1}\text{K}^{-1} \).

41. An oxygen cylinder of volume 30 litre has an initial gauge pressure of 15 atmosphere and a temperature of 27°C. After some oxygen is withdrawn from the cylinder, the gauge pressure drops to 11 atmosphere and its temperature drop to 17°C. Estimate the mass of oxygen taken out of the cylinder

\( R = 8.31 \text{/mol}\^{-1}\text{K}^{-1} \)

(molecular mass of O\(_2\) = 32)

42. At what temperature the rms speed of oxygen atom equal to r.m.s. speed of heliums gas atom at –10° C

Atomic mass of helium = 4

Atomic mass of oxygen = 32

43. Estimate the total number of molecules inclusive of oxygen, nitrogen, water vapour and other constituents in a room of capacity 25.0 m\(^3\) at a temperature of 27°C and 1 atom-pheric pressure.
44. 0.014 kg of nitrogen is enclosed in a vessel at a temperature of 27°C. How much heat has to be transferred to the gas to double the rms speed of its molecules.

**ANSWERS (1 MARK)**

1. (i) Low pressure (ii) High temperature

2. No effect

3. \[
\begin{align*}
&\text{P} \\
&\text{1/V}
\end{align*}
\]

4. Atomicity and temperature

5. 0

6. 22.4 litre

7. Gas in which intermolecular forces are absent

8. increases \(\sqrt{3}\) times

9. \(3P/2\)

10. Hydrogen (rms speed is greater)

11. \(\frac{3}{2}RT\)

12. \[P = \frac{1M}{3V}KT \quad \text{T} \propto (PV)\]

   P and V are constant then T is also constant.
ANSWERS (2 MARKS)

13. Work is done against friction. This work done is converted into heat. Temperature rises. \( PV = nRT \), As volume of tyre is const. \( P \propto T \).

14. Rate of diffusion of a gas is inversely proportional to the square root of the density. So hydrogen leaked out more rapidly.

15. Specific Heat of water is more than land (earth). Therefore for given heat change in temp. of land is more than ocean (water).

18. The air molecules travel along a zigzag path due to frequent collision as a result their displacement per unit time is very small.

19. \( c = \sqrt{\frac{3RT}{M}} = v \)  \( c = \sqrt{\frac{3R(2T)}{M/2}} = \sqrt{\frac{3RT}{M}} \)

\[ C_1 = 2V \]

20. (i) \( C \propto \sqrt{T} \) as the temperature is same rms speeds are same.

(ii) \( P = \frac{1}{3} \frac{mn c^2}{V} \Rightarrow P_1 = \frac{1}{3} \frac{mn_1 c^2}{V}, P_2 = \frac{1}{3} \frac{mn_2 c^2}{V} \)

i.e. \( \frac{P_1}{P_2} = \frac{n_1}{n_2} = \frac{1}{2} \)

21. When temp is low and pressure is high the intermolecular forces become appreciable thus the volume occupied by the molecular is not negligibly small as composed to volume of gas.

22. When piston is pulled out the volume of the gas increases, Now losses number of molecules colliding against the wall of container per unit area decreases. Hence pressure decreases.

ANSWERS (3 MARKS)

23. (i) diameter of molecule (iii) \( \gamma \propto \frac{1}{P} \)
24. Heat supplied to oxygen = Heat supplied to Helium

\[ mc_1 \Delta T_1 = mc_2 \Delta T_2 \]

\[ \frac{\Delta T_1}{\Delta T_2} = \frac{c_2}{c_1} \]

As \( c \times \frac{1}{m} \) \( m = \) molecular mass

\[ \frac{\Delta T_1}{\Delta T_2} = \frac{c_2}{c_1} = \frac{m_1}{m_2} \]

As \( m_1 > m_2 \)

\[ \Delta T_1 > \Delta T_2 \]

25. During evaporation fast moving molecules escape a liquid surface so the average kinetic energy of the molecules left behind is decreased thus the temperature of the liquid is lowered.

26. number of mole = Constant

\[ \mu_1 + \mu_2 = \mu \]

\[ \frac{P_1V_1 + P_2V_2}{RT_1 + RT_2} = \frac{P(V_1 + V_2)}{RT} \]

from Boyle's law \( P(V_1 + V_2) = P_1V_1 + P_2V_2 \)

27. \( n = \frac{pV}{kT} \)

\[ h' = \frac{2p}{kT} \]

\[ n/n' = \frac{1}{4} \]

28. \( T = \frac{pV}{\mu R} \) \( T \propto P \) \( V \) \( [\mu R = \text{constant}] \)

since \( PV \) is greater for the curve at \( T_2 \) than for the curve \( T_1 \) therefore \( T_2 > T_1 \)

Three vessels at the same pressure and temperature have same volume and contain equal number of molecules
\[ V_{\text{rms}} = \sqrt{\frac{3RT}{m}} \] 
\[ V_{\text{rms}} \propto \frac{1}{\sqrt{m}} \]

Rms speed will not be same, neon has smallest mass therefore rms speed will be largest for neon.

**ANSWERS NUMERICALS**

1. \( V_1 = 10^{-6} \text{m}^3 \)

Pressure on bubble \( P_1 = \text{water pressure} + \text{Atmospheric pressure} \)

\[ = \rho gh + \text{Patm} \]

\[ = 4.93 \times 10^5 \text{ Pa} \]

\( T_1 = 285 \text{ k}, \; T_2 = 308 \text{ k} \)

\[ \frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2} \]

\[ V_2 = \frac{4.93 \times 10^5 \times 1 \times 10^{-6} \times 308}{285 \times 1.01 \times 10^5} = 5.3 \times 10^{-6} \text{m}^3 \]

39. According to kinetic theory of gases,

\[ PV = \frac{1}{3} mV_{\text{rms}}^2 \]

At constant temperature, \( v_{\text{rms}}^2 \) is constant. As \( V \) is also constant, so \( P \propto m \)

When the mass of the gas increase by 50% pressure also increases by 50%,

\[ \therefore \text{ Final pressure} = 76 + \frac{50}{100} \times 76 = 114 \text{ cm of Hg} \]

40. For monoatomic gas, \( C_v = C_v = \frac{3}{2} R, \; n = 1 \text{ mole} \)
For diatomic gas, \( C_v = \frac{5}{2} \) R, \( n' = 3 \) mole

From conservation of energy, the molecular specific heat of the mixture

\[
C_v' = \frac{n(C_v) + n'(C_v')}{n + n'} = \frac{1 \times \frac{3}{2} R + 3 \times \frac{5}{2} R}{1 + 3} = \frac{9}{4} R
\]

or \( C_v' = \frac{9}{4} \times 8.31 = 18.7 \text{ J mole}^{-1} \text{ K}^{-1} \).

41. \( V_1 = 30 \text{ litre} = 30 \times 10^3 \text{ cm}^3 = 3 \times 10^{-2} \text{ m}^3 \)
\( P_1 = 15\times 1.013 \times 10^5 \text{ N/m}^2 \)
\( T_1 = 300 \text{ K} \)

\[
\mu_1 = \frac{P_1 V_1}{RT_1}
\]

\[
\mu_2 = \frac{P_2 V_2}{RT_2}
\]

\( P_2 = 11\times 1.013 \times 10^5 \text{ N/m}^2 \)
\( V_2 = 3 \times 10^{-2} \text{ m}^3 \)
\( T_2 = 290 \text{ K} \)
\( \mu_2 = 13.9 \)
\[= 18.3 - 13.9 = 4.4 \]

Mans of gas taken out of cylinder = 4.4\times 32 \text{ g} = 140.8 \text{ g} = 0.140 \text{ kg}.

42. \( \text{Vrms} = \left[ \frac{3PV}{M} \right]^{1/2} = \left[ 3RT \right]^{1/2} \)
Let r.m.s speed of oxygen is \((V_{\text{rms}})_1\) and of helium is \((V_{\text{rms}})_2\) is equal at temperature \(T_1\) and \(T_2\) respectively.

\[
\frac{(V_{\text{rms}})_1}{(V_{\text{rms}})_2} = \sqrt{\frac{M_2 T_1}{M_1 T_2}}
\]

\[
\left[ \frac{4T_1}{32 \times 263} \right]^{1/2} = 1
\]

\[
T_1 = \frac{32 \times 263}{4} = 2104 \text{ k}
\]

43. As Boltzmann's constant,

\[
k_B = \frac{R}{N} \quad \therefore \quad R = k_B N
\]

Now \(PV = nRT = nk_B NT\)

\(\therefore \) The number of molecules in the room

\[
= nN = \frac{PV}{Tk_B}
\]

\[
= \frac{1.013 \times 10^5 \times 25.0}{300 \times 1.38 \times 10^{-23}}
\]

\[
= 6.117 \times 10^{26}.
\]

44. Number of mole in 0.014 kg of Nitrogen.

\[
n = \frac{0.014 \times 10^3}{28} = \frac{1}{2} \text{ mole}
\]

\[
C_v = \frac{5}{2} R = \frac{5}{2} \times 2 = 5 \text{ cal/mole k}
\]

\[
\frac{V_2}{V_1} = \sqrt{\frac{T_2}{T_1}} \quad T_2 = 4T_1
\]
\[ \Delta T = T_2 - T_1 = 4T_1 - T_1 = 3T_1 \]
\[ = 3 \times 300 = 900 \text{ K} \]
\[ \Delta Q = n c_v \Delta T = \frac{1}{2} \times 5 \times 900 = 2250 \text{ cal.} \]
UNIT X

OSCILLATIONS WAVES

9.1 Periodic Motion

A motion, which repeat itself over and over again after a regular interval of time is called a periodic motion and the fixed interval of time after which the motion is repeated is called period of the motion. Examples: Revolution of earth around the sun (period one year).

9.2 Oscillatory or Vibratory Motion.

The motion in which a body moves to and fro or back and forth repeatedly about a fixed point in a definite interval of time. Oscillatory motion is also called as harmonic motion. Example: The motion of the pendulum of a wall clock.

9.3 Harmonic and Non-harmonic Oscillation.

Harmonic oscillation is that oscillation which can be expressed in terms of single harmonic function (i.e. sine or cosine function). Example: \( y = a \sin \omega t \) or \( y = a \cos \omega t \).

Non-harmonic oscillation is that oscillation which can not be expressed in terms of single harmonic function. Example: \( y = a \sin \omega t + b \sin 2 \omega t \).

9.4 Some Important Definitions.

1. **Time period**: It is the least interval of time after which the periodic motion of a body repeats itself. S.I. units of time period is second.

2. **Frequency**: It is defined as the number of periodic motions executed by body per second. S.I unit of frequency is hertz (Hz).

3. **Angular Frequency**: \( \omega = 2 \pi n \)

4. **Displacement**: Its deviation from the mean position.
(5) **Phase:** It is a physical quantity, which completely express the position and direction of motion, of the particle at that instant with respect to its mean position.

\[ Y = a \sin \theta = a \sin (\omega t + \phi_0) \] here \( \theta = \omega t + \phi_0 \) = phase of vibrating particle.

(i) **Initial phase or epoch:** It is the phase of a vibrating particle at \( t = 0 \).

(ii) **Same phase:** Two vibrating particle are said to be in same phase, if the phase difference between them is an even multiple of \( n \) or path difference is an even multiple of \( (\lambda/2) \) or time interval is an even multiple of \( (T/2) \).

(iii) **Opposite phase:** Opposite phase means the phase difference between the particle is an odd multiple of \( \pi \) or the path difference is an odd multiple of \( \lambda \) or the time interval is an odd multiple of \( (T/2) \).

(iv) **Phase difference:** If two particles performs S.H.M and their equation are \( y_1 = a \sin (\omega t + \phi_1) \) and \( y_2 = a \sin (\omega t + \phi_2) \) then phase difference \( \Delta \phi = (\omega t + \phi_2) - (\omega t + \phi_1) = \phi_2 - \phi_1 \).

9.5 Simple Harmonic Motion.

Simple harmonic motion is a special type of periodic motion, in which Restoring force \( \propto \) Displacement of the particle from mean position.

\[ F = -kx \]

Where \( k \) is known as force constant. Its S.I. unit is Newton/meter and dimension is \([MT^{-2}]\).

9.6 Displacement in S.H.M.

Simple harmonic motion is defined as the projection of uniform circular motion on any diameter of circle of reference

(i) \( y = a \sin \omega t \) when at \( t = 0 \) the vibrating particle is at mean position.

(ii) \( y = a \cos \omega t \) when at \( t = 0 \) the vibrating particle is at extreme position.
(iii) \( y = a \sin(\omega t \pm \phi) \) when the vibrating particle is \( \phi \) phase leading or lagging from the mean position.

9.7 Comparative Study of Displacement, Velocity and Acceleration.

Displacement \( y = a \sin \omega t \)

Velocity \( v = a\omega \cos \omega t \)

\[ \omega t = a\omega \sin \left(\omega t + \frac{\pi}{2}\right) \]

Acceleration \( A = -a\omega^2 \sin \omega t \)

\[ \omega t = a\omega^2 \sin (\omega t + \pi) \]

(i) All the three quantities displacement, velocity and acceleration show harmonic variation with time having same period.

(ii) The velocity amplitude is \( \omega \) times the displacement amplitude

(iii) The acceleration amplitude is \( \omega^2 \) times the displacement amplitude

(iv) In S.H.M. the velocity is ahead of displacement by a phase angle \( \pi/2 \).
(v) In S.H.M. the acceleration is ahead of velocity by a phase angle $\pi/2$.

(vi) The acceleration is ahead of displacement by a phase angle of $\pi$.

(vii) Various physical quantities in S.H.M. at different position:

<table>
<thead>
<tr>
<th>Physical quantities</th>
<th>Equilibrium position ($y = 0$)</th>
<th>Extreme Position ($y = \pm a$)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displacement $y = a \sin \omega t$</td>
<td>Minimum (Zero)</td>
<td>Maximum ($a$)</td>
</tr>
<tr>
<td>Velocity $v = \omega \sqrt{a^2 - y^2}$</td>
<td>Maximum ($a\omega$)</td>
<td>Minimum (Zero)</td>
</tr>
<tr>
<td>Acceleration $A = -\omega^2 y$</td>
<td>Minimum (Zero)</td>
<td>Maximum ($\omega^2 a$)</td>
</tr>
</tbody>
</table>

9.8 Energy in S.H.M.

A particle executing S.H.M. possesses two types of energy: Potential energy and Kinetic energy

1. **Potential energy**: $U = \frac{1}{2} m\omega^2 a^2 \sin^2 \omega t$.
   
   (i) $U_{\text{max}} = \frac{1}{2} ka^2 = \frac{1}{2} m\omega^2 a^2$ when $y = \pm a$; $\omega t = \pi/2$; $t = T/4$

   (ii) $U_{\text{min}} = 0$ when $y = 0$; $\omega t = 0$; $t = 0$.

2. **Kinetic energy**:

   $K = \frac{1}{2} ma^2 \omega^2 \cos^2 \omega t \quad K = \frac{1}{2} m\omega^2 (a^2 - y^2)$

   (i) $K_{\text{max}} = \frac{1}{2} ma^2$ when $y = 0$; $t = 0$; $\omega t = 0$

   (ii) $K_{\text{min}} = 0$ when $y = a$; $t = T/4$, $\omega t = \pi/2$

3. **Total energy**: Total mechanical energy = Kinetic energy + Potential energy

   $E = \frac{1}{2} m\omega^2 a^2$

   Total energy is not a position function i.e. it always remains constant.
(4) Energy position graph:

![Energy position graph](image)

(5) Kinetic energy and potential energy vary periodically double the frequency of S.H.M.

9.9 Time Period and Frequency of S.H.M.

Time period \( (T) = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{m}{k}} \) as \( \omega = \sqrt{\frac{k}{m}} \)

Frequency \( (n) \frac{1}{T} = \frac{1}{2\pi} \sqrt{\frac{k}{m}} \)

In general, \( m \) is called inertia factor and \( k \) is called spring factor.

Thus \( T = 2\pi \sqrt{\frac{\text{Inertia factor}}{\text{Spring factor}}} \)

9.10 Differential Equation of S.H.M.

For S.H.M. (linear) \( m \frac{d^2y}{dt^2} + ky = 0 \) \[\text{As } \omega = \sqrt{\frac{k}{m}}\]

For angular S.H.M. \( \frac{d^2\theta}{dt^2} + \omega^2 \theta = 0 \) \[\omega^2 = \frac{c}{l}\]

9.11 Simple Pendulum

Mass of the bob = \( m \)

Effective length of simple pendulum = 1; \( T = 2\pi \sqrt{\frac{l}{g}} \)
(i) The period of simple pendulum is independent of amplitude as long as its motion is simple harmonic.

(ii) Time period of simple pendulum is also independent of mass of the bob.

(iii) If the length of the pendulum is comparable to the radius of earth then

\[ T = 2\pi \sqrt{\frac{1}{g} \left( \frac{1}{l} + \frac{1}{R} \right)} \]

If \( l >> R \) \((\rightarrow \infty)\) \(1/l < 1/R\) so \( T \sqrt{\frac{R}{g}} \approx 84.6 \) minutes

(iv) The time period of simple pendulum whose point of suspension moving horizontally with acceleration \( a \) is

\[ T = 2\pi \sqrt{\frac{l}{(g^2 + a^2)^{1/2}}} \]

and \( \theta = \tan^{-1}(a/g) \)

(v) Second's Pendulum: It is that simple pendulum whose time period of vibrations is two seconds.

(vi) Work done in giving an angular displacement \( \theta \) to the pendulum from its mean position.

\[ W = U = mgl(1 - \cos \theta) \]

(vii) Kinetic energy of the bob at mean position = work done or potential energy at extreme

(viii) Various graph for simple pendulum.

9.12 Spring Pendulum

A point mass suspended from a mass less spring or placed on a frictionless horizontal plane attached with spring constitutes a linear harmonic spring pendulum

Time period \( T = 2\pi \sqrt{\frac{\text{inertia factor}}{\text{spring factor}}} \)

\[ T = 2\pi \sqrt{\frac{m}{k}} \quad \text{and} \quad \text{Frequency} \ n = \frac{1}{2\pi} \sqrt{\frac{k}{m}} \]
(i) Time of a spring pendulum is independent of acceleration due to gravity.

(ii) If the spring has a mass $M$ and mass $m$ is suspended from it, effective mass is given by $m_{\text{eff}} = m + \frac{M}{3}$

So that $T = 2\pi \sqrt{\frac{m_{\text{eff}}}{k}}$

(v) If two masses of mass $m_1$ and $m_2$ are connected by a spring and made to oscillate on horizontal surface, the reduced mass $m_r$ is given by

$$\frac{1}{m_r} = \frac{1}{m_1} + \frac{1}{m_2}$$

So that $T = 2\pi \sqrt{\frac{m_r}{k}}$

(vi) If a spring pendulum, oscillating in a vertical plane is made to oscillate on a horizontal surface, (or on inclined plane) time period will remain unchanged.

(vii) If the stretch in a vertically loaded spring is $y_0$ then

$$T = 2\pi \sqrt{\frac{m}{k}} = 2\pi \sqrt{\frac{y_0}{g}}$$

Time period does not depends on ‘$g$’ because along with $g$, $y_0$ will also change in such a way that $\frac{y_0}{g} = \frac{m}{k}$ remains constant.

(viii) Series combination: If $n$ springs of different force constant are connected in series having force constant $k_1, k_2, k_3, \ldots$ respectively then

$$\frac{1}{k_{\text{eff}}} = \frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3} + \ldots$$

(ix) Parallel combination: If the springs are connected in parallel then $k_{\text{eff}} = k_1 + k_2 + k_3 + \ldots$
(x) If the spring of force constant $k$ is divided into $n$ equal parts then spring constant of each part will become $nk$.

(xi) The spring constant $k$ is inversely proportional to the spring length.

$$k \propto \frac{1}{\text{Extension}} \propto \frac{1}{\text{Length of spring}}$$

(xii) When a spring of length $l$ is cut into two pieces of length $l_1$ and $l_2$ such that $l_1 = nl_2$.

If the constant of a spring is $k$ then spring constant of first part $k_1 = \frac{k(n+1)}{n}$

Spring constant of second part $k_2 = (n+1)k$ and ratio of spring constant $\frac{k_1}{k_2} = \frac{1}{n}$

### 9.13 Various Formulae of S.H.M.

<table>
<thead>
<tr>
<th>S.H.M. of a liquid in U tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>If a liquid of density $\rho$ contained in a vertical U tube performs S.H.M. in its two limbs. Then time period</td>
</tr>
<tr>
<td>$T = 2\pi \sqrt{\frac{L}{2g}} = 2\pi \sqrt{\frac{h}{g}}$</td>
</tr>
</tbody>
</table>

Where $L =$ Total length of liquid column, $H =$ Height of undisturbed liquid in each limb ($L = 2h$)
### S.H.M of a floating cylinder

If \( l \) is the length of cylinder dipping in liquid then time period

\[
T = 2\pi \sqrt{\frac{l}{g}}
\]

### S.H.M of ball in the neck of an air chamber

Image

\[
T = \frac{2\pi}{A} \sqrt{\frac{mV}{E}}
\]

- \( M \) = mass of the ball
- \( V \) = volume of air chamber
- \( A \) = area of cross section of neck
- \( E \) = Bulk modulus for Air

### S.H.M. of a body in a tunnel dug along any chord of earth

\[
T = 2\pi \sqrt{\frac{R}{g}} = 84.6 \text{ minutes}
\]

### S.H.M. of body in the tunnel dug along the diameter of earth

\[
T = 2\pi \sqrt{\frac{R}{g}}
\]

\( T = 84.6 \text{ minutes} \)

- \( R \) = radius of the earth = 6400 km
- \( g \) = acceleration due to gravity = 9.8 m/s² at earth's surface

1. **Free oscillation**
   
   (i) The oscillation of a particle with fundamental frequency under the influence of restoring force are defined as free oscillations
   
   (ii) The amplitude, frequency and energy of oscillation remains constant
   
   (iii) Frequency of free oscillation is called natural frequency.
(2) **Damped oscillation**

(i) The oscillation of a body whose amplitude goes on decreasing with time are defined as damped oscillation

(ii) Amplitude of oscillation decreases exponentially due to damping forces like frictional force, viscous force, hysteresis etc.

(3) **Forced oscillation**

(i) The oscillation in which a body oscillates under the influence of an external periodic force are known as forced oscillation

(ii) Resonance: When the frequency of external force is equal to the natural frequency of the oscillator. Then this state is known as the state of resonance. And this frequency is known as resonant frequency.

(4) **Maintained oscillation:** The oscillation in which the loss of oscillator is compensated by the supplying energy from an external source are known as maintained oscillation.

10.1 Wave

A wave is a disturbance which propagates energy and momentum from one place to the other without the transport of matter.

(1) **Necessary properties of the medium for wave propagation:**

(i) **Elasticity:** So that particles can return to their mean position, after having been disturbed.

(ii) **Inertia:** So that particles can store energy and overshoot their mean position.

(iii) Minimum friction amongst the particles of the medium.

(iv) Uniform density of the medium.

(2) **Mechanical waves:** The waves which require medium for their propagation are called mechanical waves.

*Example:* Waves on string and spring, waves on water surface, sound waves, seismic waves.
(3) **Non-mechanical waves:** The waves which do not require medium for their propagation are called non-mechanical or electromagnetic waves.

*Examples:* Light, heat (Infrared), radio waves, y rays. X-rays etc.

(4) **Transverse waves:** Particles of the medium execute simple harmonic motion about their mean position in a direction perpendicular to the direction of propagation of wave motion.

(i) It travels in the form of crests and troughs.

(ii) A crest is a portion of the medium which is raised temporarily.

(iii) A trough is a portion of the medium which is depressed temporarily.

(iv) Examples of transverse wave motion: Movement of string of a sitar, waves on the surface of water.

(v) Transverse waves can not be transmitted into liquids and gases.

(5) **Longitudinal waves:** If the particles of a medium vibrate in the direction of wave motion the wave is called longitudinal.

(i) It travels in the form of compression and rarefaction.

(ii) A compression $\Box$ is a region of the medium in which particles are compressed.

(iii) A rarefaction (R) is a region of the medium in which particles are rarefied.

(iv) Examples sound waves travel through air in the form of longitudinal waves.

(v) These waves can be transmitted through solids, liquids and gases.

10.2 Important Terms

(1) **Wavelength:**

(i) It is the length of one wave.

(ii) Distance travelled by the wave in one time period is known as wavelength.

$\lambda = \text{Distance between two consecutive crests or troughs.}$
(2) **Frequency:** Number of vibrations completed in one second.

(3) **Time period:** Time period of vibration of particle is defined as the time taken by the particle to complete one vibration about its mean position.

(4) **Relation between frequency and time period:** Time period = 1/Frequency
∴ \( T = \frac{1}{n} \)

(5) **Relation between velocity, frequency and wavelength:** \( v = n\lambda \).

### 10.3 Velocity of Sound (Wave motion)

1. **Speed of transverse wave motion:**

   (i) **On a stretched string:** \( v = \sqrt{\frac{T}{m}} \) (\( T \) = Tension in the string; \( m \) = Linear density of string (mass per unit length)).

   (ii) **In a solid body:** \( v = \sqrt{\frac{\eta}{\rho}} \) \( (\eta = \text{Modulus of rigidity}; \rho = \text{Density of the material}.\)

2. **Speed of longitudinal wave motion:**

   (i) **In a solid long bar** \( v = \sqrt{\frac{Y}{\rho}} \) \( (Y = \text{Young's modulus}; \rho = \text{Density}) \)

   (ii) **In a liquid medium** \( v = \sqrt{\frac{k}{\rho}} \) \( (k = \text{Bulk modulus}) \)

   (iii) **In gases** \( v = \sqrt{\frac{k}{\rho}} \)

### 10.4 Velocity of Sound in Elastic Medium

Velocity of sound in any medium is

\[ v = \sqrt{\frac{E}{\rho}} \] \( (E = \text{Elasticity of the medium}; \rho = \text{Density of the medium}) \)
(1) \(v_{\text{steel}} > v_{\text{water}} > v_{\text{air}}\) 5000 m/s > 1500 m/s > 330 m/s

(2) **Newton’s formula:** He assumed that propagation of sound is isothermal

\[v_{\text{air}} = \sqrt{\frac{K}{\rho}} = \sqrt{\frac{P}{\rho}}\]

As \(K = E_0 = P; E_0 = \) Isothermal elasticity; \(P = \) Pressure.

By calculation \(v_{\text{air}} = 279\) m/sec.

However the experimental value of sound in air is 332 m/sec

(3) **Laplace correction:** He modified that propagation of sound in air is adiabatic process.

\[v = \sqrt{\frac{k}{\rho}} = \sqrt{\frac{E_{\phi}}{\rho}}\]  \(\text{(As } k = E_{\phi} = \gamma \rho = \text{Adiabatic elasticity)}\)

\(v = 331.3\) m/s \((\gamma_{\text{Air}} = 1.41)\)

(4) **Effect of density:** \(v = \sqrt{\frac{\gamma P}{\rho}} \Rightarrow v \propto \frac{1}{\sqrt{\rho}}\)

(5) **Effect of pressure:** Velocity of sound is independent of the pressure (when \(T = \) constant)

(6) **Effect of temperature:** \(v \propto \sqrt{T(\ln K)}\)

When the temperature change is small then \(v = v_0 (1 + \alpha t)\)

Value of \(\alpha = 0.608 \frac{\text{m/s}}{\degree \text{C}} = 0.61\) (Approx.)

(7) **Effect of humidity:** With rise in humidity velocity of sound increases.

(8) Sound of any frequency or wavelength travels through a given medium with the same velocity.

(8) Sound of any frequency or wavelength travels through a given medium with the same velocity.
10.5 Reflection of Mechanical Waves

10.6 Progressive Wave

1. These waves propagate in the forward direction of medium with a finite velocity.
2. Energy and momentum are transmitted in the direction of propagation of waves.
3. In progressive waves, equal changes in pressure and density occurs at all points of medium.
4. Various forms of progressive wave function.

   (i) $y = A \sin (\omega t - kx)$ Where $y =$ displacement

   $A =$ amplitude

   $\omega =$ angular frequency

   $n =$ frequency

   $k =$ propagation constant

   $T =$ time period

   $\lambda =$ wave length

   $v =$ wave velocity

   $t =$ instantaneous time
(ii) \( y = A \sin \left( \frac{\omega t - 2\pi x}{\lambda} \right) \)

(iii) \( y = A \sin \left( \frac{t}{T} - \frac{x}{\lambda} \right) \)

(iv) \( y = A \sin \frac{2\pi}{\lambda} (vt - x) \)

(v) \( y = A \sin \omega \left( t - \frac{x}{v} \right) \)

(a) If the sign between \( t \) and \( x \) terms is negative the wave is propagating along positive X-axis and if the sign is positive then the wave moves in negative X-axis direction.

(b) The Argument of sin or cos function i.e. \((\omega t - kx)\) = Phase.

(c) The coefficient of \( t \) gives angular frequency
\[ \omega = 2\pi n = \frac{2\pi}{T} = vk. \]

(d) The coefficient of \( x \) gives propagation constant or wave number \( k = \frac{2\pi}{\lambda} = \frac{\omega}{v} \).

(e) The ratio of coefficient of \( t \) to that of \( x \) gives wave or phase velocity, i.e. \( v = \frac{\omega}{k} \).

(f) When a given wave passes from one medium to another its frequency does not change.

(g) From \( v = n\lambda \Rightarrow v \propto \lambda \therefore n = \text{constant} \Rightarrow \frac{v_1}{v_2} = \frac{\lambda_1}{\lambda_2} \).
Some terms related to progressive waves

(i) **Wave number** \((\bar{n})\): The number of waves present in unit length.
\[ (\bar{n}) = \frac{1}{\lambda}. \]

(ii) **Propagation constant** \((k)\): \[ k = \frac{\phi}{x}. \]
Where \(k = \frac{\omega}{v} = \frac{\text{Angular velocity}}{\text{Wave velocity}} \) and \( k = \frac{2\pi}{\lambda} = 2\pi \frac{\bar{n}}{\lambda}. \)

(iii) **Wave velocity** \((v)\): \[ v = \frac{\omega}{k} = n\lambda = \frac{\omega \lambda}{2\pi} = \frac{\lambda}{T}. \]

(iv) **Phase and phase difference** \(\phi (x, t) = \frac{2\pi}{\lambda} (vt - x). \)

(v) **Phase difference** = \(\frac{2\pi}{T} \times \text{Time difference}. \)

(vi) **Phase difference** = \(\frac{2\pi}{\lambda} \times \text{Path difference}. \)
\[ \Rightarrow \text{Time difference} = \frac{T}{\lambda} \times \text{Path difference}. \]

10.7 Principle of Superposition

If \(y_1, y_2, y_3, \ldots \) are the displacements at a particular time at a particular position, due to individual waves, then the resultant displacement.
\[ y = y_1 + y_2 + y_3 + \ldots \]

Important applications of superposition principle: (a) Stationary waves, (b) Beats.

10.8 Standing Waves or Stationary Waves

When two sets of progressive wave trains of same type (both longitudinal or both transverse) having the same amplitude and same time period/frequency/wavelength travelling with same speed along the same straight line in opposite
directions superimpose, a new set of waves are formed. These are called stationary waves or standing waves.

Characteristics of standing waves:

(1) The disturbance confined to a particular region

(2) There is no forward motion of the disturbance beyond this particular region.

(3) The total energy is twice the energy of each wave.

(4) Points of zero amplitude are known as nodes.

The distance between two consecutive nodes is \( \frac{\lambda}{2} \)

(5) Points of maximum amplitude is known as antinodes. The distance between two consecutive antinodes is also \( \lambda/2 \). The distance between a node and adjoining antinode is \( \lambda/4 \).

(6) The medium splits up into a number of segments.

(7) All the particles in one segment vibrate in the same phase. Particles in two consecutive segments differ in phase by 180°.

(8) Twice during each vibration, all the particles of the medium pass simultaneously through their mean position.

</tr>
</tbody>
</table>

(i) Harmonics are the notes/sounds of frequency equal to or an integral multiple of fundamental frequency \((n)\).

(ii) Overtones are the notes/sounds of frequency twice/thrice/four times the fundamental frequency \((n)\).

(iii) In organ pipe an antinode is not formed exactly at the open end rather it is formed a little distance away from the open end outside it. The distance of antinode from the open end of the pipe is \(0.6r\) (where \(r\) is radius of organ pipe). This is known as end correction.

10.10 Vibration of a String

General formula of frequency \(n_p = \frac{p}{2L} \sqrt{\frac{T}{m}}\)
\[ L = \text{Length of string}, \quad T = \text{Tension in the string} \]

\[ m = \text{Mass per unit length (linear density)}, \quad p = \text{mode of vibration} \]

1. The string will be in resonance with the given body if any of its natural frequencies coincides with the body.

2. If \( M \) is the mass of the string of length \( L \), \( m = \frac{M}{L} \).

So \( n = \frac{1}{2Lr} \sqrt{T/\pi p} \) \( (r = \text{Radius}, \ p = \text{Density}) \)

**10.11 Beats**

When two sound waves of slightly different frequencies, travelling in a medium along the same direction, superimpose on each other, the intensity of the resultant sound at a particular position rises and falls regularly with time. This phenomenon is called beats.

1. **Beat period**: The time interval between two successive beats \( (i.e. \text{two successive maxima of sound}) \) is called beat period.

2. **Beat frequency**: The number of beats produced per second is called beat frequency.

3. **Persistence of hearing**: The impression of sound heard by our ears persist in our mind for \( l/10^{th} \) of a second.

So for the formation of distinct beats, frequencies of two sources of sound should be nearly equal \( (\text{difference of frequencies less than } 10) \)

4. **Equation of beats**: If two waves of equal amplitudes ‘\( a \)’ and slightly different frequencies \( n_1 \) and \( n_2 \), travelling in a medium in the same direction then equation of beats is given by

\[ y = A \sin (n_1 - n_2)t \text{ where } A = 2a \cos \pi (n_1 - n_2)t = \text{Amplitude of resultant wave}. \]

Amplitude of resultant wave.
(5) **Beat frequency:** \( n = n_1 - n_2 \)

(6) **Beat period:** \( \frac{1}{\text{Beat frequency}} = \frac{1}{n_1 - n_2} \)

### 10.12 Doppler Effect

Whenever there is a relative motion between a source of sound and the listener, the apparent frequency of sound heard by the listener is different from the actual frequency of sound emitted by the source.

Apparent frequency \( n' = \left( \frac{(v + v_m) - v_L}{v + v_m - v_S} \right) n \)

Here \( n = \) Actual frequency; \( v_L = \) Velocity of listener; \( v_S = \) Velocity of source

\( v_m = \) Velocity of medium and \( v = \) Velocity of sound wave

**Sign convention:** All velocities along the direction \( S \) to \( L \) are taken as positive and all velocities along the direction \( L \) to \( S \) are taken as negative. If the medium is stationary \( v_m = 0 \) then \( n' = \left( \frac{v - v_L}{v - v_S} \right) n \)

(1) No Doppler effect takes place \((n' = n)\) when relative motion between source and listener is zero.

(2) Source and listener moves at right angle to the direction of wave propagation. \((n' = n)\)

(i) If the velocity of source and listener is equal to or greater than the sound velocity then Doppler effect is not observed.

(ii) Doppler effect does not says about intensity of sound.

(iii) Doppler effect in sound is asymmetric but in light it is symmetric.
UNIT X - OSCILLATIONS & WAVES

ONE MARK QUESTIONS

1. How is the time period effected, if the amplitude of a simple pendulum is increased?

2. Define force constant of a spring.

3. At what distance from the mean position, is the kinetic energy in simple harmonic oscillator equal to potential energy?

4. How is the frequency of oscillation related with the frequency of change in the of K.E and P.E of the body in S.H.M.?

5. What is the frequency of total energy of a particle in S.H.M.?

6. How is the length of seconds pendulum related with acceleration due gravity of any planet?

7. If the bob of a simple pendulum is made to oscillate in some fluid of density greater than the density of air (density of the bob density of the fluid), then time period of the pendulum increased or decrease.

8. How is the time period of the pendulum effected when pendulum is taken to hills or in mines?

9. A transverse wave travels along x-axis. The particles of the medium must move in which direction?

11. Sound waves from a point source are propagating in all directions. What will be the ratio of amplitudes at distances of x meter and y meter from the source?

12. Does the direction of acceleration at various points during the oscillation of a simple pendulum remain towards mean position?

13. What is the time period for the function \( f(t) = \sin \omega t + \cos \omega t \) may represent the simple harmonic motion?

14. When is the swinging of simple pendulum considered approximately SHM?
15. Can the motion of an artificial satellite around the earth be taken as SHM?

16. What is the phase relationship between displacement, velocity and acceleration in SHM?

17. What forces keep the simple pendulum in motion?

18. How will the time period of a simple pendulum change when its length is doubled?

19. What is a harmonic wave function?

20. If the motion of revolving particle is periodic in nature, give the nature of motion or projection of the revolving particle along the diameter.

21. In a forced oscillation of a particle, the amplitude is maximum for a frequency $w_1$ of the force, while the energy is maximum for a frequency $w_2$ of the force. What is the relation between $w_1$ and $w_2$?

22. Which property of the medium are responsible for propagation of waves through it?

23. What is the nature of the thermal change in air, when a sound wave propagates through it?

24. Why does sound travel faster in iron than in water or air?

25. When will the motion of a simple pendulum be simple harmonic?

26. A simple harmonic motion of acceleration ‘a’ and displacement ‘x’ is represented by $a + 4\pi^2x = 0$. What is the time period of S.H.M?

27. What is the main difference between forced oscillations and resonance?

28. Define amplitude of S.H.M.

29. What is the condition to be satisfied by a mathematical relation between time and displacement to describe a periodic motion?

30. Why the pitch of an organ pipe on a hot summer day is higher?

31. Under what conditions does a sudden phase reversal of waves on reflection takes place?
32. The speed of sound does not depend upon its frequency. Give an example in support of this statement.

33. If an explosion takes place at the bottom of lake or sea, will the shock waves in water be longitudinal or transverse?

34. Frequency is the most fundamental property of wave, why?

35. How do wave velocity and particle velocity differ from each other?

36. If any liquid of density higher than the density of water is used in a resonance tube, how will the frequency change?

37. Under what condition, the Doppler effect will not be observed, if the source of sound moves towards the listener?

38. What physical change occurs when a source of sound moves and the listener is stationary?

39. What physical change occurs when a source of sound is stationary and the listener moves?

40. If two sound waves of frequencies 480 Hz and 536 Hz superpose, will they produce beats? Would you hear the beats?

41. Define non dissipative medium.

2 MARKS QUESTIONS

42. Which of the following condition is not sufficient for simple harmonic motion and why?

   (i) acceleration and displacement
   (ii) restoring force and displacement

43. The formula for time period T for a loaded spring, \( T = \frac{2\pi \sqrt{\frac{\text{displacement}}{\text{acceleration}}}}{\pi} \)

   Does the time period depend on length of the spring?

44. Water in a U-tube executes S.H.M. Will the time period for mercury filled up to the same height in the tube be lesser of greater than that in case of water?
45. There are two springs, one delicate and another hard or stout one. For which spring, the frequency of the oscillator will be more?

46. Time period of a particle in S.H.M depends on the force constant $K$ and mass $m$ of the particle \( T = 2\pi \sqrt{\frac{m}{k}} \). A simple pendulum for small angular displacement executes S.H.M approximately. Why then is the time period of a pendulum independent of the mass of the pendulum?

47. What is the frequency of oscillation of a simple pendulum mounted in a cabin that is falling freely?

48. Why can the transverse waves not be produced in air?

49. The velocity of sound in a tube containing air at 27°C and pressure of 76 cm of Hg is 330 ms\(^{-1}\). What will be its velocity, when pressure is increased to 152 cm of mercury and temperature is kept constant?

50. Even after the breakup of one prong of tuning fork it produces a round of same frequency, then what is the use of having a tuning fork with two prongs?

51. Why is the sonometer box hollow and provided with holes?

52. The displacement of particle in S.H.M may be given by \( y = a \sin(\omega t + \phi) \) show that if the time \( t \) is increased by \( 2\pi/\omega \), the value of \( y \) remains the same.

53. What do you mean by the independent behaviour of waves?

54. Define wave number and angular wave number and give their S.I. units.

55. Why does the sound travel faster in humid air?

56. Use the formula \( v = \sqrt{\frac{\gamma p}{\rho}} \) to explain, why the speed of sound in air

   (a) is independent of pressure

   (b) increase with temperature

57. Differentiate between closed pipe and open pipe at both ends of same length for frequency of fundamental note and harmonics.
58. Bats can ascertain distances, directions, nature and size of the obstacle without any eyes, explain how?

59. In a sound wave, a displacement node is a pressure antinode and vice-versa. Explain, why.

60. How does the frequency of a tuning fork change, when the temperature is increased?

61. Explain, why can we not hear an echo in a small room?

62. What do you mean by reverberation? What is reverberation time?

3 MARKS QUESTIONS

63. Show that for a particle in linear simple harmonic motion, the acceleration is directly proportional to its displacement of the given instant.

64. Show that for a particle in linear simple harmonic motion, the average kinetic energy over a period of oscillation, equals the average potential energy over the same period.

65. Deduce an expression for the velocity of a particle executing S.H.M when is the particle velocity (i) Maximum (ii) minimum?

66. Draw (a) displacement time graph of a particle executing SHM with phase angle $\phi$ equal to zero (b) velocity time graph and (c) acceleration time graph of the particle.

67. Show that a linear combination of sine and cosine function like $x(t) = a \sin \omega t + b \cos \omega t$ represents a simple harmonic. Also, determine its amplitude and phase constant.

68. Show that in a S.H.M the phase difference between displacement and velocity is $\pi/2$, and between displacement and acceleration is $n$.

69. Derive an expression for the time period of the horizontal oscillations of a massless loaded spring.

70. Show that for small oscillations the motion of a simple pendulum is simple harmonic. Derive an expression for its time period.
71. Distinguish with an illustration among free, forced and resonant oscillations.

72. In reference to a wave motion, define the terms
   (i) amplitude  (ii) time period
   (iii) frequency  (iv) angular frequency
   (v) wave length and wave number.

73. What do you understand by phase of a wave? How does the phase change with time and position.

74. At what time from mean position of a body executive S.H.M. kinetic energy and potential energy will be equal?

**LONG ANSWER QUESTIONS**

75. Derive expressions for the kinetic and potential energies of a simple harmonic oscillator. Hence show that the total energy is conserved in S.H.M. in which positions of the oscillator, is the energy wholly kinetic or wholly potential?

76. One end of a U-tube containing mercury is connected to a section pump and the other end is connected to the atmosphere. A small pressure difference is maintained between the two columns. Show that when the suction pump is removed, the liquid in the U-tube executes S.H.M.

77. Discuss the Newton's formula for velocity of sound in air. What correction was applied to it by Laplace and why?

78. What are standing waves? Desire and expression for the standing waves. Also define the terms node and antinode and obtain their positions.

79. Discuss the formation of harmonics in a stretched string. Show that in case of a stretched string the first four harmonics are in the ratio 1:2:3:4,

80. Give the differences between progressive and stationary waves.

81. If the pitch of the sound of a source appears to drop by 10% to a moving person, then determine the velocity of motion of the person. Velocity of sound = 30 ms⁻¹.
82. Give a qualitative discussion of the different modes of vibration of an open organ pipe.

83. Describe the various modes of vibrations of a closed organ pipe.

84. What are beats? How are they produced? Briefly discuss one application for this phenomenon.

85. Show that the speed of sound in air increases by 61 cm s\(^{-1}\) for every 1°C rise of temperature.

**NUMERICALS**

86. The time period of a body executing S.H.M is 1 s. After how much time will its displacement be \(\frac{1}{\sqrt{2}}\) of its amplitude.

87. A particle is moving with SHM in a straight line. When the distance of the particle from the equilibrium position has values \(x_1\) and \(x_2\), the corresponding value of velocities are \(u_1\) and \(u_2\). Show that the time period of oscillation is given by

\[
t = 2\pi \left[ \frac{x_2^2 - x_1^2}{u_1^2 - u_2^2} \right]^{\frac{1}{2}}
\]

88. Find the period of vibrating particle (SHM), which has acceleration of 45 cm s\(^{-2}\), when displacement from mean position is 5 cm.

89. A 40 gm mass produces on extension of 4 cm in a vertical spring. A mass of 200 gm is suspended at its bottom and left pulling down. Calculate the frequency of its vibration.

90. The acceleration due to gravity on the surface of the moon is 1.7 ms\(^{-2}\). What is the time period of a simple pendulum on the moon, if its time period on the earth is 3.5 s? \([g = 9.8 \text{ ms}^{-2}]\)

91. A particle executes simple harmonic motion of amplitude \(A\).

   (i) At what distance from the mean position is its kinetic energy equal to its potential energy?

   (ii) At what points is its speed half the maximum speed?
92. A particle executes S.H.M of amplitude 25 cm and time period 3s. What is the minimum time required for the particle to move between two points 12.5 cm on either side of the mean position?

93. The vertical motion of a huge piston in a machine is approximately S.H.M with a frequency of 0.5 s$^{-1}$. A block of 10kg is placed on the piston. What is the maximum amplitude of the piston's S.H.M. for the block and piston to remain together?

94. At what temperature will the speed of sound be double its value at 273°K?

95. A spring balance has a scale that reads from 0 to 50 kg. The length of the scale is 20 cm. A body suspended from this spring, when displaced and released, oscillates with a period of 0.60 s. What is the weight of the body?

96. If the pitch of the sound of a source appears to drop by 10% to a moving person, then determine the velocity of motion of the person. Velocity of sound = 330 ms$^{-1}$.

97. You are riding in an automobile of mass 3000 kg. Assuming that you are examining the oscillation characteristics of its suspension system. The suspension sags 15 cm when the entire automobile is placed on it. Also, the amplitude of oscillation decreases by 50% during one complete oscillation, Estimate the values of (a) the spring constant and (b) the damping constant 'b' for the spring and shock absorber system of one wheel assuming that each wheel supports 750 kg.

98. A string of mass 2.5 kg is under a tension of 200N. The length of the stretched string is 20m. If a transverse jerk is struck at one end of the string, how long does the disturbance take to reach the other end?

99. Which of the following function of time represent (a) periodic and (n) non-periodic motion? Give the period for each case of periodic motion. [w is any positive constant].

(i) $\sin \omega t + \cos \omega t$

(ii) $\sin \omega t + \cos 2\omega t + \sin 4\omega t$

(iii) $e^{-\omega t}$

(iv) $\log (\omega t)$
100. The equation of a plane progressive wave is given by the equation 
\[ y = 10 \sin 2\pi (t - 0.005x) \] 
where \( y \) and \( x \) are in cm and \( t \) in seconds. Calculate the amplitude, frequency, wave length and velocity of the wave.

101. A tuning fork arrangement (pair) produces 4 beats s\(^{-1}\) with one fork of frequency 288 cps. A little wax is placed on the unknown fork and it then produces 2 beats s\(^{-1}\). What is the frequency of the unknown fork?

\[ \text{Unknown frequency} = \text{Known frequency} \pm \text{Beat frequency} \]
\[ = 288 \pm 4 = 292 \text{ or } 284 \text{ Hz.} \]

On loading with wax, the frequency decreases, the beat frequency also decreases to 2.

\[ \therefore \text{Unknown frequency} = 292 \text{ cps (higher one)}. \]

102. A pipe 20 cm long is closed at one end, which harmonic mode of the pipe is resonantly excited by a 430 Hz source? Will this same source can be in resonance with the pipe, if both ends are open? Speed of sound = 340 ms\(^{-1}\).

103. The length of a wire between the two ends of a sonometer is 105 cm. Where should the two bridges be placed so that the fundamental frequencies of the three segments are in the ratio of 1 : 3 : 15 ?

104. The transverse displacement of a string (clamped at its two ends) is given by

\[ y(x,t) = 0.06 \sin \frac{2\pi}{3} x \cos 20\pi t \]

where \( x, y \) are in m and \( t \) is in s. The length of the string is 1.5 m and its mass is 3.0\times10^{-2} \text{ kg}. Answer the following.

(a) Does the function represent a travelling or a stationary wave?

(b) Interpret the wave as a superposition of two waves travelling in opposite directions. What are the wavelength frequency and speed of propagation of each wave?

(c) Determine the tension in the string.
105. A wire stretched between two rigid supports vibrates in its fundamental mode with a frequency 45 Hz. The mass of the wire is \(3.5 \times 10^{-2}\) kg and its linear density is \(4.0 \times 10^{-2}\) kg m\(^{-1}\). What is (a) the speed of transverse wave on the string and (b) the tension in the string?

106. A steel rod 100 cm long is clamped at its middle. The fundamental frequency of longitudinal vibrations of the rod as given to be 2.53 kHz. What is the speed of sound in steel?

**ANSWERS OF ONE MARK QUESTIONS**

1. No effect on time period when amplitude of pendulum is increased or decreased.

2. The spring constant of a spring is the change in the force it exerts, divided by the change in deflection of the spring. \((K = f/x)\)

3. At \(x = a/\sqrt{2}\), KE = PE = \(\frac{1}{4}m_0\omega^2a^2\)

4. P.E. or K.E. completes two vibrations in a time during which S.H.M completes one vibration or the frequency of P.E. or K.E. is double than that of S.H.M

5. The frequency of total energy of particle is S.H.M is zero because it remains constant.
6. Length of the seconds pendulum proportional to (acceleration due to gravity)

7. Increased

8. As \( T \propto \frac{1}{\sqrt{g}} \), \( T \) will increase.

9. In the \( y-z \) plane or in plane perpendicular to \( x \)-axis.

10. It is the angle covered per unit time or it is the quantity obtained by multiplying frequency by a factor of \( 2\pi \).

\[ \omega = 2\pi n, \ S.I. \ unit \ is \ rad \ s^{-1} \]

11. Intensity = amplitude\(^2 \propto \frac{1}{(\text{distance})^2} \)

\[ \therefore \text{required ratio} = \frac{y}{x} \]

12. No, the resultant of Tension in the string and weight of bob is not always towards the mean position.

13. \( T = \frac{2\pi}{\omega} \)

14. Swinging through small angles.

15. No, it is a circular and periodic motion but not SHM.

16. In SHM, -The velocity leads the displacement by a phase \( \pi/2 \) radians and acceleration leads the velocity by a phase \( \pi/2 \) radians.

17. The component of weight \((mg \sin \theta)\)

18. \( \sqrt{2} \) times, as \( T \propto \sqrt{\ell} \)

19. A harmonic wave function is a periodic function whose functional form is sine or cosine.

20. S.H.M

21. Both amplitude and energy of the particle can be maximum only in the case of resonance, for resonance to occur \( \omega_1 = \omega_2 \).

23. When the sound wave travel through air adiabatic changes take place in the medium.

24. Sound travel faster in iron or solids because iron or solid is highly elastic as compared to water (liquids) or air (gases).

25. When the displacement of bob from the mean position is so small that \( \sin \theta \approx \theta \).

26. \[ a = -4\pi^2x = -\omega^2x \Rightarrow \omega = 2\pi \]
   \[ T = \frac{2\pi}{\omega} = \frac{2\pi}{2\pi} = 1 \text{s} \]

27. The frequency of external periodic force is different from the natural frequency of the oscillator in case of forced oscillation but in resonance two frequencies are equal.

28. The maximum displacement of oscillating particle on either side of its mean position is called its amplitude.

29. A periodic motion repeats after a definite time interval \( T \).
   
   So, \( y(t) = y(t + T) = y(t + 2T) \) etc.

30. On a hot day, the velocity of sound will be more since (frequency proportional to velocity) the frequency of sound increases and hence its pitch increases.

31. On reflection from a denser medium, a wave suffers a sudden phase reversal.

32. If sounds are produced by different musical instruments simultaneously, then all these sounds are heard at the same time.

33. Explosion at the bottom of lake or sea create enormous increase in pressure of medium (water). A shock wave is thus a longitudinal wave travelling at a speed which is greater than that of ordinary wave.

34. When a wave passes through different media, velocity and wavelength change but frequency does not change.
35. Wave velocity is constant for a given medium and is given by $V = n\lambda$. But particle velocity changes harmonically with time and it is maximum at mean position and zero at extreme position.

36. The frequency of vibration depends on the length of the air column and not on reflecting media, hence frequency does not change.

37. Doppler effect will not be observed, if the source of sound moves towards the listener with a velocity greater than the velocity of sound. Same is also true if listener moves with velocity greater than the velocity of sound towards the source of sound.

38. Wave length of sound changes.

39. The number of sound waves received by the listener changes.

40. Yes, the sound waves will produce 56 beats every second. But due to persistence of hearing, we would not be able to hear these beats.

41. A medium in which speed of wave motion is independent of frequency of wave is called non-dispersive medium. For sound, air is non dispersive medium.

ANSWERS OF TWO MARKS QUESTIONS

42. Condition (i) is not sufficient, because direction of acceleration is not mentioned. In SHM, the acceleration is always in a direction opposite to that of the displacement.

43. Although length of the spring does not appear in the expression for the time period, yet the time period depends on the length of the spring. It is because, force constant of the spring depends on the length of the spring.

44. The time period of the liquid in a U-tube executing S.H.M. does not depend upon density of the liquid, therefore time period will be same, when the mercury is filled up to the same height in place of water in the U-tube.

45. We have, $v = \frac{1}{2\pi} \sqrt{\frac{k}{m}} = \frac{1}{2\pi} \sqrt{\frac{g}{\ell}}$
So, when a hard spring is loaded with a mass $m$. The extension I will be lesser w.r.t. delicate one. So frequency of the oscillation of the hard spring will be more and if time period is asked it will be lesser.

46. Restoring force in case of simple pendulum is given by

$$ F = \frac{mg}{l} y \Rightarrow K = mg / \ell $$

So force constant itself proportional to $m$ as the value of $k$ is substituted in the formula, $m$ is cancelled out.

47. The pendulum is in a state of weight less ness i.e. $g = 0$. The frequency of pendulum

$$ v = \frac{1}{2\pi} \sqrt{\frac{g}{l}} = 0 $$

48. For air, modulus of rigidity is zero or it does not possess property of coheission. Therefore transverse waves can not be produced.

49. At a given temperature, the velocity of sound is independent of pressure, so velocity of sound in tube will remain $330ms^{-1}$.

50. Two prongs of a tuning fork set each other in resonant vitorations and help to maintain the vibrations for a longer time.

51. When the stem of the a tuning fork gently pressed against the top of sonometer box, the air enclosed in box also vibrates and increases the intensity of sound. The holes bring the inside air incontact with the outside air and check the effect of elastic fatigue.

52. The displacement at any time $t$ is

$$ y = a \sin(\omega t + \phi) $$

\[\therefore\] displacement at any time $(t + 2\pi/\omega)$ will be

$$ y = a \sin(\omega(t + 2\pi/\omega) + \phi) = [\sin(\omega t + \phi) + 2\pi]] $$

$$ y = a \sin(\omega t + \phi) [\because \sin(2\pi + \phi) = \sin\phi] $$

Hence, the displacement at time $t$ and $(t + 2\pi/\omega)$ are same.
53. When a number of waves travel through the same region at the same time, each wave travels independently as if all other waves were absent. This characteristic of wave is known as independent behaviour of waves. For example we can distinguish different sounds in a full orchestra.

54. Wave number is the number of waves present in a unit distance of medium. \( (\bar{v} = 1/\lambda) \) S.I. unit of \( k \) is rad m\(^{-1}\).

Angular wave number or propagation constant is \( 2\pi/\lambda \). It represents phase change per unit path difference and denoted by \( k = 2\pi/\lambda \). S.I. unit of \( k \) is rad m\(^{-1}\).

55. Because the density of water vapour is less than that of the dry air hence density of air decreases with the increase of water vapours or humidity and velocity of sound inversely proportional to square root of density.

56. Given, \( v = \sqrt{\frac{\gamma P}{\rho}} \)

(a) Let \( V \) be the volume of 1 mole of air, then

\[ \rho = \frac{M}{V} \quad \text{or} \quad V = \frac{M}{\rho} \]

for 1 mole of air \( PV = RT \)

\[ \therefore \frac{PM}{\rho} = RT \quad \text{or} \quad \frac{P}{\rho} = \frac{RT}{M} \]

\[ \Rightarrow v = \sqrt{\frac{\gamma RT}{M}} \quad (i) \]

So at constant temperature \( v \) is constant as \( \gamma \), \( R \) and \( M \) are constant

(b) From equation (i) we know that \( V \propto \sqrt{T} \), so with the increase in temperature velocity of sound increases.
57. (i) In a pipe open at both ends, the frequency of fundamental note produced is twice as that produced by a closed pipe of same length.

(ii) An open pipe produces all the harmonics, while in a closed pipe, the even harmonics are absent.

58. Bats emit ultrasonic waves of very small wavelength (high frequencies) and so high speed. The reflected waves from an obstacle in their path give them idea about the distance, direction, nature and size of the obstacle.

59. At the point, where a compression and a rarefaction meet, the displacement is minimum and it is called displacement node. At this point, pressure difference is maximum i.e. at the same point it is a pressure antinode. On the other hand, at the mid point of compression or a rarefaction, the displacement variation is maximum i.e. such a point is pressure node, as pressure variation is minimum at such point.

60. As the temperature increases, the length of the prong of the tuning fork increases. This increases the wavelength of the stationary waves set up in the tuning fork. As frequency, $v \propto \frac{1}{\lambda}$, so frequency of the tuning fork decreases.

61. For an echo of a simple sound to be heard, the minimum distance between the speaker and the walls should be 17m, so in any room having length less than 17 m, our ears can not distinguish between sound received directly and sound received after reflection.

62. The phenomenon of persistence or prolongation of sound after the source has stopped emitting sound is called reverberation. The time for which the sound persists until it becomes inaudible is called the reverberation time.

SOLUTION/HINTS OF NUMERICALS

86. Soln : $y = r \sin wt = r \sin \frac{2\pi t}{T}$

Here $y = \frac{1}{3} r$ and $T = 1s$
\[ \therefore \frac{1}{r^2} = r \sin \frac{2\pi t}{T} \Rightarrow 2\pi t = \pi/4 \]

\[ \Rightarrow t = \frac{1}{4} \text{s} \]

87. When \( x = x_1, v = u_1 \)
When \( x = x_2, v = u_2 \)

As \( v = \omega \sqrt{A^2 - x^2} \)

\[ \therefore u_1 = \omega \sqrt{A^2 - x_1^2} \quad \text{or} \quad u_1^2 = \omega^2 (A^2 - x_1^2) \quad \text{...(i)} \]

and \( u_2 = \omega \sqrt{A^2 - x_2^2} \quad \text{or} \quad u_2^2 = \omega^2 (A^2 - x_2^2) \quad \text{...(ii)} \)

Subtracting (ii) from (i), we get

\[ u_1^2 - u_2^2 = (A^2 - x_1^2) - \omega^2 (A^2 - x_2^2) = \omega^2 (x_2^2 - x_1^2) \]

or \[ \omega = \sqrt{\frac{u_1^2 - u_2^2}{x_2^2 - x_1^2}} \]

\[ T = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{x_2^2 - x_1^2}{u_1^2 - u_2^2}} \]

88. Soln: Here \( y = 5 \text{ cm} \) and acceleration \( a = 45 \text{ cm s}^{-2} \)

We know \( a = \omega^2 y \)

\[ \therefore 45 = \omega^2 \times 5 \quad \text{or} \quad \omega = 3 \text{ rad s}^{-1} \]

And \( T = \frac{2\pi}{\omega} = \frac{2\pi}{3} = 2.095 \text{ s} \)

89. Soln:

Here \( mg' = 40 \text{ g} = 40 \times 980 \text{ dyne} \); \( l = 4 \text{ cm} \).

say \( k \) is the force constant of spring, then

\[ mg = kl \quad \text{or} \quad k = \frac{mg}{l} \]
\[ k = \frac{40 \times 980}{4} = 9800 \text{ dyne cm}^{-1} \]

when the spring is loaded with mass \( m = 200 \text{ g} \)

\[ v = \frac{1}{2\pi} \sqrt{\frac{k}{m}} = \frac{1}{2\pi} \sqrt{\frac{9800}{200}} \]

\[ = 1.113 \text{ s}^{-1} \]

90. Here on earth, \( T = 3.5 \text{ s} \); \( g = 9.8 \text{ ms}^{-2} \)

for simple pendulum \( T = \frac{l}{g} \)

\[ 3.5 = 2\pi \sqrt{\frac{l}{9.8}} \quad (i) \]

on moon, \( g' = 1.7 \text{ ms}^{-2} \) and if \( T' \) is time period

then \( T' = 2\pi \sqrt{\frac{l}{1.7}} \) \quad (ii)

Dividing eq(ii) by eq.(i), we get

\[ \frac{T'}{3.5} = \sqrt{\frac{9.8}{1.7}} \text{ or } T' = \sqrt{\frac{9.8}{1.7}} \times 3.5 = 8.4 \text{ s} \]

92. Soln :

Given, \( r = 25 \text{ cm} \); \( T = 3 \text{ s} \); \( y = 12.5 \text{ cm} \)

The displacement \( y = r \sin \frac{2\pi t}{T} \)

\[ 12.5 = 25 \sin \frac{2\pi t}{3} \text{ or } \frac{2\pi t}{3} = \frac{\pi}{6} \text{ or } t = 0.25 \text{ s}. \]

The minimum time taken by the particle \( 2t = 0.5 \text{ s} \)
93. Soln: Given, \( v = 0.5 \text{ s}^{-1} \), \( g = 9.8 \text{ m/s}^{-1} \)

\[
a = \omega^2 y = (2\pi v)^2 y = 4\pi^2 v^2 y
\]

\( a_{\text{max}} \) at the extreme position i.e. \( r = y \)

\[
a_{\text{max}} = 4\pi^2 v^2 r \text{ and } a_{\text{av}} = g \text{ to remain in contact.}
\]

or \( r = \frac{g}{4\pi^2 v^2} = \frac{9.8}{4\pi^2 (0.5)^2} = 0.993 \text{ m} \)

94. Say \( v_1 \) in the velocity of sound at \( T_1 = 273^\circ K \) and \( v_2 = 2v_1 \) at temperature \( T_2 \)

Now \[
\frac{v_2}{v_1} = \frac{\sqrt{T_2}}{\sqrt{T_1}} \therefore \frac{2v_1}{v_1} = \frac{\sqrt{T_2}}{\sqrt{273}}
\]

or \( T_2 = 4 \times 273 = 1092^\circ K \)

95. Here \( m = 50 \text{ kg}, l = 0.2 \text{ m} \)

we know \( mg = kl \) or \( k = \frac{mg}{l} = \frac{50 \times 9.8}{0.2} = 2450 \text{ N/m}^{-1} \)

\( T = 0.60 \text{ s} \) and \( M \) is the mass of the body, then using

\[
T = 2\pi \sqrt{\frac{M}{k}} \Rightarrow M = \frac{2450 \times (0.60)^2}{4\pi^4} = 22.34 \text{ kg}
\]

Weight of body \( Mg = 22.34 \times 9.8 = 218.93 \text{ N} \).

96. Soln: Speed of wave (transverse) in stretched string

\[
v = \sqrt{\frac{T}{M}} \text{ T is Tension, m is mass per unit length}
\]

\[
v = \sqrt{\frac{400}{8 \times 10^{-3} \times 0.8}} = 200 \text{ ms}^{-1}
\]
97. Apparent frequency heard by the person is given by

\[ v' = \left( \frac{v - v_o}{v} \right) v \text{ or } \frac{v}{v} = \frac{v - v_o}{v} \]

But \( \frac{v'}{v} = \frac{900}{100} = \frac{9}{10}, \ v = 330 \ \text{ms}^{-1} \)

\[ \therefore \ \frac{9}{10} = 330 - v_o \]

or \( 330 - v_o = \frac{9}{10} \times 330 = 297 \)

\[ \therefore \ v_o = 330 - 297 = 33 \ \text{ms}^{-1} \]

As the pitch of the sound appears to decrease, so the person is moving away from the observer.

98. Soln : Given \( T = 200N \), length of sting \( l = 20m \)

total mass of the string = 2.5 kg

\[ \therefore \ \text{mass per unit length of the string} \]

\[ m = \frac{2.5}{20} = 0.125 \ \text{kg m}^{-1} \]

Now \( v = \sqrt{\frac{T}{m}} = \sqrt{\frac{200}{0.125}} = 40 \ \text{ms}^{-1} \)

Hence time taken by the transverse wave to reach other end

\[ t = \frac{l}{v} = \frac{20}{40} = 0.5 \ \text{s} \]

99. Soln : Given speed of sound in air, \( v = 343 \ \text{ms}^{-1} \)

length of wire, \( l = 12.0 \ \text{m}, \ \text{total mass of wire} \ M = 2.10 \ \text{kg} \)

\[ M = \frac{M}{l} = \frac{2.10}{12.0} = 0.175 \ \text{kgm}^{-1} \]
Now
\[ v = \sqrt{\frac{T}{m}} \Rightarrow T = v^2 m = (343)^2 \times 0.175 = 20,588.6 N = 2.06 \times 10^4 N \]

100. Solu, here \( y = 10 \sin 2\pi (t - 0.005x) \)

\[ y = 10 \sin \frac{2\pi}{200} (200t - x) \quad \text{(i)} \]

The equation of a travelling wave is given by

\[ y = a \sin \frac{2\pi}{\lambda} (vt - x) \quad \text{(ii)} \]

Comparing the equation (i) and (ii), we have

\( a = 10 \text{ cm}, \quad \lambda = 200 \text{ cm} \) and \( v = 200 \text{ ms}^{-1} \)

Now \( v = \frac{\lambda}{\lambda} = \frac{200}{200} = 1 \text{ Hz} \)

101. Solu, \( L = 100 \text{ cm} \quad T = 20 \text{ kg} = 20 \times 1000 \times 980 \text{ dyne} \)

\[ m = \frac{4.9}{100} = 0.049 \text{ g cm}^{-1} \]

Now the frequency of fundamental note produced,

\[ v = \frac{1}{2L} \sqrt{\frac{T}{m}} \]

\[ v = \frac{1}{2 \times 100} \sqrt{\frac{20 \times 1000 \times 980}{0.049}} = 100 \text{ Hz} \]

102. Solu: The frequency of \( n^{th} \) mode of vibration of a pipe closed at one end is given by

\[ v_n = \frac{(2n - 1)v}{4L} \]

river \( v = 340 \text{ ms}^{-1} \), \( L = 20 \text{ cm} = 0.2 \text{ m}; \quad v_n = 430 \text{ Hz} \)

[Class XI : Physics] 302
Therefore, first mode of vibration of the pipe is excited, for open pipe since n must be an integer, the same source can not be in resonance with the pipe with both ends open.

103. Total length of the wire, \( L = 105 \text{ cm} \)

\[
\nu_1 : \nu_2 : \nu_3 = 1 : 3 : 15
\]

Let \( L_1 \), \( L_2 \) and \( L_3 \) be the length of the three parts. As \( \nu \propto \frac{1}{L} \)

\[
\therefore \ L_1 : L_2 : L_3 = \frac{1}{1} : \frac{1}{3} : \frac{1}{15} \quad = \quad 15 : 5 : 1
\]

Sum of the ratios = 15 + 5 + 1 = 21

\[
\therefore \ L_1 = \frac{15}{21} \times 105 = 75 \text{ cm}; \quad L_2 = \frac{5}{21} \times 105 = 25 \text{ cm};
\]

\[
L_3 = \frac{1}{21} \times 105 = 5 \text{ cm}
\]

Hence the bridges should be placed at 75 cm and (75 + 25 =) 100 cm from one end.

104. \( y(x, t) = 0.06 \sin \frac{2\pi}{3} \times \cos 120\pi t \)  

(i)

(a) The displacement which involves harmonic functions of \( x \) and \( t \) separately represents a stationary wave and the displacement, which is harmonic function of the form \((vt \pm x)\), represents a travelling wave. Hence, the equation given above represents a stationary wave.

(b) When a wave pulse \( y_1 = \sin \frac{2\pi}{\lambda} (vt - x) \) travelling along x-axis is superimposed by the reflected pulse.
\[ y_2 = -a \sin \frac{2\pi}{\lambda} (vt + x) \] from the other end, a stationery wave is formed and is given by

\[ y = y_1 + y_2 = -2a \sin \frac{2\pi}{\lambda} \times \cos \frac{2\pi}{\lambda} vt \quad \text{(ii)} \]

Comparing the eqs (i) and (ii) we have

\[ \frac{2\pi}{\lambda} = \frac{2\pi}{3} \text{ or } \lambda = 3 \text{m} \]

\[ \frac{2\pi}{\lambda} v = 120\pi \text{ or } v = 60\lambda = 60 \times 3 = 180 \text{ ms}^{-1} \]

Now frequency \( \gamma = \frac{v}{\lambda} \)

\[ = \frac{180}{3} = 60 \text{ Hz} \]

(c) Velocity of transverse wave in a string is given by

\[ v = \sqrt{\frac{T}{m}} \]

Here \( m = \frac{3 \times 10^{-2}}{1.5} = 2 \times 10^{-2} \text{ kgm}^{-1} \)

Also \( v = 180 \text{ ms}^{-1} \)

\[ \therefore \quad T = v^2 m = (180)^2 \times 2 \times 10^{-2} = 648 \text{N} \]

105. Solution: frequency of fundamental mode, \( v = 45 \text{Hz} \)

Mass of wire \( M = 3.5 \times 10^{-2} \text{ kg}; \) mass per unit length, \( m = 4.0 \times 10^{-2} \text{ kgm}^{-1} \)

\[ \therefore \quad \text{Length of wire} = L = \frac{M}{m} = \frac{3.5 \times 10^{-2}}{4.0 \times 10^{-2}} = 0.875 \text{ m} \]

(a) for fundamental mode \( L = \frac{\lambda}{2} \) or \( \lambda = 2L = 0.875 \times 2 = 1.75 \text{ m} \)

\[ \therefore \quad \text{velocity} \quad v = \nu \lambda = 45 \times 1.75 = 78.75 \text{ ms}^{-1} \]
(b) The velocity of transverse wave

\[ v = \sqrt{\frac{T}{m}} \]

\[ T = \frac{v^2 m}{(78.75)^2 \times 4.0 \times 10^2} = 248.6 \text{ N} \]

106. Solution:

Given: \( u = 2.53 \ \text{kHz} = 2.53 \times 10^3 \text{Hz} \)

(L) Length of steel rod = 100 cm = 1 m.

when the steel rod clamped at its middle executes longitudinal vibrations of its fundamental frequency, then

\[ L = \frac{\lambda}{2} \text{ or } \lambda = 2L = 2 \times 1 = 2 \text{ m} \]

The speed of sound in steel

\[ v = n\lambda = 2.53 \times 10^3 \times 2 = 5.06 \times 10^3 \text{ ms}^{-1} \]
VALUE BASED QUESTIONS

UNIT 1 UNIT AND MEASUREMENT

(1) Ajay and Rahul were playing in the garden on a sunny day. It was very hot so after playing for some time they sat under a tree. While relaxing they wondered how tall the tree would be? After some time Rahul’s sister also joined them. Rahul asked her sister to guess the height of the tree. His sister said that she can measure the height of the tree. She measured it using an indirect method.

a What are the values displayed by Rahul & Ajay?
b What values are displayed by Rahul’s sister?
c Explain the Triangulation method to measure the height of an accessible object.

(2) Veena called a scrap dealer to dispose off old newspaper. The scrap dealer started weighing the newspaper using a spring balance. Veena’s daughter who was sitting over there stopped the scrap dealer & asked him to show the spring balance. She noticed that the pointer was slightly below zero mark. She asked him to adjust zero first of the spring balance.

a What are the values displayed by Veena’s daughter?
b A faulty spring balance with least count 100 gm has its pointer two marks below. What will be the correct weight of the body whose weight is measured as 2kg 700 g by this spring balance.

UNIT 2-KINEMATICS

(3) A metro station is coming up in Rita’s colony. The station will be built over the colony park. The RWA agrees to give up the park for need of convenient mode of commuting. Rita urges her neighbours to plant more trees to compensate for this loss.

(a) Mention any two values which are reflected in Rita’s behavior?
(b) A metro train starts from a station with an acceleration of $2\text{m/s}^2$ for 8 seconds. It then runs for 12 seconds with the speed acquired. Finally it retards at uniform rate of $4\text{ m/s}^2$ and stops. Find the total distance travelled?

(4) Mohan a student of class XI was returning from his school. He observed that a speedy car hit a person just outside his house. The car driver did not bother to stop the car and to take care the injured man. Mohan noted the car number and informed the police and immediately rushed to the nearby hospital which was 10 Km away via the shortest route which remains most of the time overcrowded, Therefore victim had to be taken via a longer route of 15 Kms within 20 minutes and finally victim was saved.

a. What values are shown by Mohan ?

b. If you have met with any such type of situation what action would have been taken by you to help the needy person?

c. Calculate the average speed and average velocity of the police van in going from accident place to Hospital.

UNIT 3 LAWS OF MOTION

(5) A shooting competition was held in the school. Rohan who was very fond of this sport started practicing in his school. During his initial attempts he was unable to hit the target though he aimed the target to the best of his skills. He did not give up. He went to his instructor who advised him firstly to hold the gun tightly to his shoulder and then aim it a little above the target. Rohan followed his mentor’s instructions and by practicing a lot, he became successful and got the first prize in the event.

(a) What values are displayed by Rohan ?

(b) Explain why the gun should be aimed a little above the target ?

(c) Why does instructor advised Rohan to hold the gun firmly to his shoulder?

(6.) During the Olympics, Shashank and his friends were watching and enjoying the cycling event on TV. As the race progressed Shashank was surprised to observe that during the circular turn on the track all the cyclist bent
inwards. Next day he asked his Physics teacher who explained him the reason. He shared this amazing information with his friends.

(a) What values does Shashank possess?

(b) Explain what his teacher might have given the reason to Shashank?

(c) A cyclist speeding at 18 km/hr on a level road takes a sharp circular turn of radius 3m without reducing the speed. The coefficient of static friction between the tyres and the road is 0.1. Will the cyclist slip while taking the turn?

UNIT 4 WORK ENERGY AND POWER

On the day of annual inter-house meet of a school, a tug of war between the teams of two houses ASHOKA and SHIVAJI, was organized. Team of Ashoka house won the event. During the event some players of Shivaji team got injured on being dragged on the ground by the team Ashoka. A few spectators started laughing on the players. Ryan, captain of the team Ashoka came forward and asked them not to make mockery of others and called the doctor of the school on the ground. Doctor treated the injured players.

(a) What values are shown by Ryan, captain of the Ashoka team?

(b) What type of work is done by the Ashoka & Shivaji team?

(c) Give two examples of daily life in which work done is (i) positive (ii) negative

8. While returning from the school, on their way to home, Sohan and Mohan, two brothers saw a speedy truck coming from the wrong side and collided head on with the car. The car was dragged backward and stopped after hitting the pavement. The injured car driver got trapped on the seat and needed medical as well as physical help but no one came forward to rescue him. Sohan immediately called the police and ambulance while Mohan initiated to break open the door to pull the driver out. The life of the driver was saved due to timely medical help provided to him.

(a) Comment on the behavior of two brothers in respect of the values they possess.
(b) A massive body collides against a light stationary body. What are the velocities of two bodies after collision?

**UNIT 5 SYSTEM OF PARTICLES AND ROTATIONAL MOTION**

(9) Rajeev a student of class XI. He had two identical spheres one hollow and other solid. He told his younger brother Ram that he had the ability to spin these two spheres with different speeds while i would impart same energy to both. Ram asked him the reason. He told that it is a pure magic. Reema, Rajeev's sister told Ram that it is not a magic. she could also do the same.

(a) How can two identical spheres, one hollow and other solid spin with different speeds?

(b) What values are shown by Reema?

(10) Mohit was watching a program on the topic “Tornado” on the discovery channel. He came to know that the speed of inner layers of the whirling wind in a tornado is alarmingly high. He wanted to know the reason behind it. Next day he asked his physics teacher who explained him the concept.

(a) Name the value displayed by Mohit.

(b) What value were displayed by his teacher?

(c) Name the principle involved in this phenomenon.

(d) Gravitation

11. Rahul’s younger brother Robin was reading science fiction stories. In one of the stories Robin read that there is a sister planet to the earth in the same orbit as the earth but 180° ahead of the earth. Therefore we cannot see this sister of the earth as it is always behind the sun. Robin was eager to know, how he could see the sister planet of the earth. He asked Rahul to find the solution of this problem Rahul told Robin that he could see the sister planet of earth if he sat in a rocket and move his rocket in its orbit with speed larger than the speed of earth. Robin was satisfied with the explanation. Now answer the following questions

(a) What is the attitude of Robin?
(b) Can one see the sister planet by firing the rocket to slow down in its orbit?

(c) What values are displayed by Rahul?

(12) Shweta and Richa are good friends and living in a city near the equator. Shweta went to a country located near north pole of the earth with her parents. Her friend Richa requested to bring a gold necklace as gold was cheaper in that country. Shweta purchased the necklace. Specification about rate, size, weight, year of manufacturing was mentioned on the necklace box. Richa gave that necklace to a lab where all the specifications were checked. Richa told Shweta that she was cheated. However Shweta explained that weight of the body at equater is less than at poles. Shweta asked Richa to return the necklace to her because she was not interested to spoil her friendship with Richa.

(a) Why weight of the necklace less at equator than poles?

(b) What values displayed by Shweta?

UNIT VII PROPERTIES OF BULK MATTER

(13) Raju is a class XI student of science. He was going to udaipur with his mother the train was late and her mother was getting impatient. Suddenly the arrival of train was announced & his mother rushed near the railway line on the edge of platform to board the coming train. Raju stopped his mother from standing near the railway line.

a. What are the values displayed by Raju.

b. Why did he stop his mother

c. At what speed will the velocity head of a stream of water be equal to 4.9 m.

(14) Rajesh was arranging his table, when he suddenly dropped a bottle of ink & the ink got scattered. On the floor, his mother rushed for a piece of cloth to clean the floor jaya, rajesh’s younger sister quickly brought a blotting paper & spread it on the ink. In just few seconds the ink was absorbed by blotting paper.
A. What are the values displayed by Jaya.

B. Why wet ink is absorbed by blotting paper.

15. Ram has two gases in different containers at the same initial; Temperature $T_0$, Pressure $P_0$, and Volume $V_0$. He expanded these two gases to the same volume, one adiabatically and the other isothermally. He told his friend that in both the cases the final pressure, work done in expanding and temperature will be same. His friend told him that these parameters are not same and gave a correct explanation for this.

   A. What values are shown by Ram and his friend?
   B. What is the correct answer of it?

16. Class XI students went for a picnic. After some time they decided to have coffee. Ram took out his coffee flask and before pouring in cups, he shook the flask vigorously. His friend Shyam him the reason for shaking the flask. Ram said that by shaking he is adding heat to coffee and thereby increasing its temperature.

   (a) What values are shown by Ram?
   (b) What values are shown by Shyam?
   (c) Give the reason why temperature increases on shaking?

UNIT 9 KINETIC THEORY OF GAS

17. In a laboratory scientist James was working on an experiment to measure the specific heat of gas. While measuring specific heat of gases such as $\text{Cl}_2$, $\text{C}_2\text{H}_6$, he observed that experimental values were greater than the predicted values as given in NCERT physics class 11.

   Table 13.1

   Predicted values of specific heat capacities of gases (ignoring vibrational modes).

<table>
<thead>
<tr>
<th>Nature of Gas</th>
<th>$C_i$ (J mol$^{-1}$K$^{-1}$)</th>
<th>$C_r$ (J mol$^{-1}$K$^{-1}$)</th>

</tbody>
</table>
There was some error regarding degree of freedom of different mode of gas. He could not find the error. Then his friend Advin helped him by suggesting him to include vibrational mode of motion in the calculation.

(a) What values were displayed by Advin?

(b) What is the effect of addition of vibrational mode?

18. Mahesh and his family were sitting in their home on a holiday. Suddenly they heard some leakage sound from kitchen. Vipin, Mahesh's son said that it may be leakage of gas from cylinder but Mahesh did not agree with Vipin as there was no smell at all. But Vipin was firm on his statement and he told his father that he should check the cylinder. Mahesh went to kitchen and found that Vipin was right. He took preventive steps for leakage and appreciated Vipin.

(a) What values were displayed by Vipin?

(b) What values were displayed by Mahesh?

UNIT X OSCILLATION AND WAVE

19. Viresh was playing with pen cap during recess in school. He blew into pen cap and suddenly he heard a wistle sound from the cap. He told about this sound to his friend Krishna. He also did same with his pen cap of different length, same sound was produced but of different frequency. They could not understand the reason behind the sound. They went to their physics teacher. He told that sound is developed due to formation of standing wave in cap.

(a) What values were displayed by Physics teacher?

(b) What is the reason of different pitch in caps?

(c) What is standing wave?

20. A under officer Ramesh was training the children for march-past. On their way they come across a bridge. Then Ramesh stopped the children from marching on the bridge.

(a) Comment upon the values of Ramesh.

(b) Also explain what is meant by Resonance.
CLASS : XI

COMMON ANNUAL SCHOOL EXAMINATION, 2014-15

SUBJECT : PHYSICS

[Time : 3 Hrs.] [M. M. : 70]

General Instructions:

1. All questions are compulsory. There are 26 questions in all.

2. This question paper has five sections : Section A, B, C, D and E.

3. Section A contains five questions of one mark each. Section B contains five questions of two marks each, Section C contain twelve questions of three marks each, Section D contains one value based question of four marks and Section E contains three questions of five marks each.

4. There is no overall choice. However, an internal choice has been provided in one question of two marks, one question of three marks and all the three questions of five marks weightage. You have to attempt only one of the choices in such questions.

Section-A

1. A body is travelling in a straight line with a uniformly increasing speed. Plot a graph which represents the change in distance (s) travelled with time (t)

2. A pebble of mass 0.05 kg is thrown vertically upward. Give the direction and magnitude of the net force on the pebble, at the highest point where it is momentarily at rest. (g = 10 ms⁻²).

3. Write dimensional formula for compressibility.

4. The pressure is increased on a gas, then what would be its effect on the viscosity?
5. Two stars radiate maximum energy at wavelength \(3.6 \times 10^{-7} \text{m}\) and \(4.8 \times 10^{-7} \text{m}\) respectively. What is the ratio of their surface temperatures.

**Section-B**

6. The bob of a pendulum is released from a horizontal position. If the length of the pendulum is 1m what is the speed with which the bob arrives at the lower most point given that it dissipates 10% of it intial energy against air resistance. \((g = 10 \text{ ms}^{-2})\)

7. Draw the graph showing the variation of acceleration due to gravity with 
   (a) height above the earth’s surface.
   (b) depth below the earth’s surface.

8. Find the torque of a force \((7\hat{i} + 3\hat{j} - 5\hat{k}) \text{N}\) about the orgin, The force acts on a particle whose position vector is \((\hat{i} - \hat{j} + \hat{k}) \text{m}\).

**OR**

A truck and a car moving with the same kinetic energies (KE) on a straight road. Their engines are simultaneously switched off which one will stop at a lesser distance?

9. Show that the function of time \(y = (\sin \omega t - \cos \omega t)\) represents simple harmonic motion.

10. Two springs of force constants \(K\) and \(2K\) are connected to a block of \(m\) as shown below. what is the frequency of oscillation of this block?

**Section-C**

11. A cyclist is riding with a speed of \(27 \text{km/h}\) as he approaches a circular turn (on the road) of radius 80m, he applies brakes and reduces his speed at the constant rate 0.50 \text{m/s}^2. Find the magnitude and direction of the net acceleration of the cyclist on circular turn?

12. A cricketer can throw a ball to a maximum horizontal distance of 100 m. How much high above the ground can the cricketer throw the same ball.
13. The period of oscillation of a simple pendulum is $T = 2\pi \sqrt{\frac{l}{g}}$ measured value of $l$ is 20.0 cm known to 1mm accuracy and time for 100 oscillations of the pendulum is found to be 90s using a wrist watch of 1s resolution. What is the accuracy in determination of $g$?

14. Define the following:
   
   (a) A stronomical unit and Parsec
   
   (b) Average speed and average velocity
   
   (c) Dimension of a physical quantity.

15. State parallel axes theorem. Apply this theorem to find the moment of inertia of a solid sphere about the tangent of its surface.

16. Define escape speed. Show that its value on the surface is $v_e = \sqrt{2gR}$.

   $R \rightarrow$ radius of planet (Earth)

17. For two different type of rubber stress – strain curves are shown:

   (a) To make a shock absorber which rubber will you prefer and why?

   (b) To make cartyre which of the two rubber would you prefer and why?

18. Two exactly similar rain drops felling with terminal velocity of $(2)^{\frac{1}{3}}$ ms$^{-1}$ coalesce to form a bigger drop. Find the terminal velocity of the bigger drop.
19. What is the effect of pressure on melting point of a substance? What is the relegation. Give its one practical application.

20. You have the following group of particles, \( n \). represents no. of molecules with speed \( v_i \) (ms\(^{-1}\)):

<table>
<thead>
<tr>
<th>( n_i )</th>
<th>2</th>
<th>4</th>
<th>8</th>
<th>6</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( v_i )</td>
<td>1.0</td>
<td>2.0</td>
<td>3.0</td>
<td>4.0</td>
<td>5.0</td>
</tr>
</tbody>
</table>

Calculate
(a) the average speed
(b) the r.m.s. speed
(c) the most probable speed

21. Explain why?

(a) inspite of the formula \( v = \sqrt{\frac{\gamma P}{\rho}} \), the speed of sound in air independent of pressure where \( \gamma \rightarrow \) ratio of specific heats \( i.e. \gamma = \frac{C_p}{C_v}, \rho \rightarrow \) density, \( P \rightarrow \) pressure.

(b) bats can ascertain distances, directions, nature and the size of the obstacles without any "eyes".

22. Differentiate the following: (a) wave velocity and particle velocity, (b) harmonics and overtones

**OR**

(a) What is beat phenomenon?

(b) Observer
A whistle revolves in a circle with angular velocity of $\omega = 20 \text{ rad s}^{-1}$. If the frequency of the sound is 385 Hz and speed is 340 ms$^{-1}$ than find the frequency heard by the observer when the whistle is at B.

$$\text{Observer}$$

$$\text{B}$$

50 cm

Section - D

23. One day Ajit was having morning with his grand father.

Then a cyclist took sharp turn on a plane curved road and fall down. Ajit helped him in getting up and asked him to keep the speed slow at sharp turn, the grandfather asked Ajit why every vehicle at sharp turn slows down Ajit explained this reason to his grandfather logically.

(a) Which values are displayed by Ajit and his grandfather.

(b) What is the maximum speed of cyclist on a sharp turn of a plane road (circular) so that he would not turnover if the radius of the circular road is 3m and coefficient of friction between road and the type is 0.1.

Section - E

24. (a) What is an adiabatic process ? Derive expression for the work done during such process.

(b) A refrigerator is to maintain eatable kept inside at 9°C. If the room temperature is 36°C calculate the co-efficient of performance.

OR

State first law of thermodynamics. On the basis of this establish the relation between two molar specific heats for an ideal gas.

25. Prove that the velocity $v$ of translation of a rolling body (like a ring, disc, cylinder or sphere) at the bottom of an inclined plane of height $h$ is given by:
\[ \nu^2 = \frac{2gh}{\left(1 + \frac{K^2}{R^2}\right)} \]

Note \(K\) is the radius of gyration of the body about its symmetry axis, and \(R\) is the radius of the body. The body starts from rest at the top of the plane.

OR

A 1 kg block situated on a rough incline is connected to a spring of spring constant 100 Nm\(^{-1}\) as shown below. The block is release from rest with the spring in the unstretched position. The block moves 10cm down the incline before coming to rest. Find the coefficient of friction between the block and the incline.

Assume that the spring has a negligible mass and the pulley is frictionless.

\[ k = 100 \text{ Nm}\(^{-1}\) \]

26. State parallelogram law of vector addition and Find the magnitude and direction of resultant of two vectors \(\vec{A}\) and \(\vec{B}\) in terms of their magnitude and angle between them.

OR

The speed time graph of a particle moving along a fixed direction is shown below. Obtain the distance traversed by the particle between (a) \(t = 0s\) to \(5s\), (b) \(t = 2s\) to \(6s\)
1. \[ s = ut + \frac{1}{2}at^2 \]

For \( u = 0 \); \[ s = \frac{1}{2}at^2 \]

Or \[ s \propto t^2 \]

2. Net force on the pebble = \( mg = 0.05 \times 10 = 0.5 \) N vertically downwards.

3. \([M^{-1}L^1T^2]\)

4. Independent of pressure.

5. By Wien’s law, \( \lambda m \propto \frac{1}{T} \), so \( \frac{\lambda'}{\lambda_m} = 4.8 \times 10^{-7} \) m

\[ \lambda_m = 3.6 \times 10^{-7} \text{m} \]

\[ \frac{T}{T'} = \frac{\lambda'}{\lambda_m} = 4 : 3 \]
SECTION ‘B’

6. Here, $h = 1\text{m}$

P. E. at A = $mgh$

K. E. at B = $\frac{1}{2}mv^2$

As 10% of P.E. dissipated against air resistance so,

$\frac{1}{2}mv^2 = 90\%$ of $mgh$

$v = \sqrt{18}\text{ ms}^{-1}$

7. (i) $g' = \frac{1}{(R+h)^2}$ or $g' = \frac{1}{r^2}$

(ii) $g' = g\left(1 - \frac{d}{R}\right)$ i.e. $g \alpha (R-d)$

8. $r = \hat{i} - \hat{j} + \hat{k}$

$F = 7\hat{i} - 3\hat{j} - 5\hat{k}$

$\tau = \hat{r} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & 1 \\ 7 & 3 & -5 \end{vmatrix} = 2\hat{i} + 12\hat{j} + 10\hat{k}$

OR

By Work-Energy Theorem,

Loss in K.E. = Work done against the force of friction × Distance

K.E. = $f \times s = \mu R \times s = \mu mg \times s$

Or $s = \frac{\text{KE.}}{\mu mg}$
For constant K.E., \( s \alpha \frac{1}{m} \)

So truck will stop in lesser distance than the car.

9. \( x(t) = \sin \omega t - \cos \omega t \)

\[
= \sqrt{2} \left( \sin \omega t \times \frac{1}{\sqrt{2}} - \cos \omega t \times \frac{1}{\sqrt{2}} \right) = \sqrt{2} \left( \sin \omega t \cos \frac{\pi}{4} - \cos \omega t \sin \frac{\pi}{4} \right)
\]

\[
= \sqrt{2} \sin \left( \omega t - \frac{\pi}{4} \right)
\]

Moreover,

\[
x \left( t + \frac{2\pi}{\omega} \right) = \sqrt{2} \left( \omega t + 2\pi - \frac{\pi}{4} \right) = x(t)
\]

Hence, it represents simple harmonic motion.

10. Springs are in parallel combinations.

So equivalent K’ = K + 2K = 3K

In S.H.M., Frequency = \( \frac{1}{2\pi} \sqrt{\frac{K}{m}} = \frac{1}{2\pi} \sqrt{\frac{3K}{m}} \)

11. \( r = 80, a_T = 0.5 \text{ ms}^{-2} \)

\( v = 27 \text{ kmh}^{-1} = 7.5 \text{ ms}^{-1} \)

\( \frac{a_c v^2}{r} = 0.7 \text{ ms}^{-2} \)

\( a = \sqrt{a_c^2 + a_r^2} = \sqrt{(0.7)^2 + (0.5)^2} = 0.86 \text{ ms}^{-2} \)

\( \tan \theta = \frac{a_c}{a_r} = \frac{0.7}{0.5} = 1.4 \)

\( \theta = \tan^{-1} (1.4) \approx 54^\circ 28' \)
12. \( R_{\text{max}} = \frac{u^2}{g} = 100 \text{ m} \)

\[ u = \sqrt{100g} \]

For upward throw of the ball, we have
\[ v = 0, \ a = -g, \ s = ? \]
\[ v^2 - u^2 = 2as \]
\[ s = \frac{-100g}{-2g} = 50 \text{ m} \]

\[ g = \frac{4\pi^2l}{T^2} \]

\[ \frac{\Delta g}{g}(100) = \frac{\Delta l}{l}(100) + 2\frac{\Delta T}{T}(100) \]

\( \Delta l = 0.1 \text{ cm} \)

\( \Delta T = 1 \text{ s} \)

\( l = 20 \text{ cm} \)

\( T = 90 \text{ s} \)

\[ \frac{\Delta g}{g}(100) = 3\% \]

14. Correct definition (a) + (b) + (c).
15. Correct statement.

\[ I_{CD} = I_{AB} + MR^2 \]

Using parallel axis theorem,

\[ I_{CD} = \frac{2}{5} MR^2 + MR^2 = \frac{7}{5} MR^2 \]

16. Correct derivation (a) + (b)

17. The area of hysteresis loop is proportional to the energy dissipated by the material as heat when material undergoes loading and unloading.

(a) B material having larger loop area would absorb more energy when subjected to vibration/shock.

(b) A material is preferred for car tyre because, the energy dissipation must be minimised to avoid excessive heating of the car tyre.

18. \[ \frac{4}{3} \pi R^3 = 2 \times \frac{4}{3} \pi r^3 \text{ Or } \frac{R}{r} = 2^{\frac{3}{3}} r \]

Terminal velocity of smaller drop, \[ v_1 = \frac{2r^2}{9\eta} (\rho' - \rho)g \]

Terminal velocity of the bigger drop, \[ v_2 = \frac{2R^2}{9\eta} (\rho' - \rho)g \]

(Given \( v_1 = 2^{1/3} \text{ ms}^{-1} \)) \( v_2 = 2^{2/3} v_1 = 2^{2/3} \times 2^{1/3} = 2 \text{ ms}^{-1} \)

19. The melting point of those substances which expand on melting, increase with increase in pressure while the melting point of those substances which contract on melting, decrease with increase in pressure.

The phenomenon 'a' in which ice melts when pressure is increased and again freezes when pressure is removed is called relegation.
Practical examples.

\[ v_{av} = \frac{n_1v_1 + n_2v_2 + \ldots + n_nv_n}{n_1 + n_2 + \ldots + n_n} = 3.17 \text{ ms}^{-1} \]

\[ v_{rms} = \sqrt{\frac{n_1v_1^2 + n_2v_2^2 + \ldots + n_nv_n^2}{n_1 + n_2 + \ldots + n_n}} = 3.37 \text{ ms}^{-1} \]

Most probable speed = 3.0 ms\(^{-1}\)

(a) \[ v = \sqrt{\frac{rP}{\rho}} \]

\[ v = \sqrt{\frac{rRT}{mV}} \quad \Rightarrow \quad \sqrt{\frac{rRT}{m}} = \text{constant} \]

[PV = RT at constant temperature, PV = constant, \( \rho = \frac{m}{V^3} \)]

(b) Correct explanation.

22. Correct differentiation.

OR

(a) Definition

(b) \[ v_8 = n_0 = 0.50 \times 20 = 10 \text{ m/s} \]

\[ v = 340 \text{ m/s}, \gamma = 385 \text{ Hz} \]

\[ \gamma' = \frac{v}{v - \gamma} = \frac{340}{340 - 10} \times 385 \text{ Hz} \]

23. (a) Grandfather : Quest for knowledge, curiosity, etc.

Ajit : Good observant, social, logical thinking, scientific temper, sense of responsibility, etc.

(b) \[ v_{\text{max}} = \sqrt{\mu Rg} = \sqrt{(0.1) \times 3 \times 10} = \sqrt{3} \text{ m/s} \]
24. (a) Correct explanation.
Correct derivation.

(b) Co-efficient of performance = \[ \frac{T_2}{T_1 - T_2} = \frac{282}{309 - 282} = 10.4 \]

OR

Correct statement.

Derivation of \( C_p - C_v = R \)

25. (image)

\[ N - Mg \cos \theta = 0 \]
\[ Ma = Mg \sin \theta - f \]
\[ \tau = f \times R = I \alpha = Mk^2 \left( \frac{a}{R} \right) \]

Or \[ f = \frac{Mk^2}{R^2} a \]

\[ Ma = Mg \sin \theta - \frac{Mk^2}{R^2} a \]

\[ a = \frac{g \sin \theta}{\left(1 + \frac{k^2}{R^2}\right)} \]

\[ v^2 - u^2 = 2as \ [u = 0, \ \frac{h}{s} = \sin \theta ] \]

\[ v = \sqrt{\frac{2gh}{\left(1 + \frac{k^2}{R^2}\right)}} \]
Normal reaction, \( N = mg \cos 30^{\circ} \)

Force of friction, \( f = \mu N = \mu mg \cos 30^{\circ} \)

Let force on the block = \( mg \sin 30^{\circ} - f \)

\( = mg (\sin 30^{\circ} - \mu \cos 30^{\circ}) \)

Distance moved = 10 cm = 0.1 m

In equilibrium, \( W = P.E. \) of stretched spring = \( \frac{1}{2} kx^2 \)

\( mg(\sin30^{\circ} - \mu \cos30^{\circ}) \times 0.1 = \frac{1}{2} \times 100 \times (0.1)^2 \)

\( \mu = 0.126 \)

26. (a) Correct statement

(b) Magnitude & direction of resultant.

OR

(a) Distance travelled by the particle between

\( t = OS \) to 5S

\( = \text{Area of } \triangle OAC = \frac{1}{2} \times 5 \times 12 \)

\( = 30 \text{ m} \)
(b) Acceleration along OA

\[ v = u + at \]

\[ a = +2.4 \text{ ms}^{-2} \]

Acceleration along AB

\[ a = -2.4 \text{ ms}^{-2} \]

Distance travelled by the particle between \( t = 2 \text{s} \) to \( t = 5 \text{s} \)

= Area of trapezium MDAC

= 25.2 m

Distance travelled by the particle between \( t = 5 \text{s} \) to \( t = 6 \text{s} \)

= Area of trapezium CAEN

= 10.8 m

* Find \( v_1 \) & \( v_2 \) using \( v = u + at \)
CLASS - XI

SAMPLE PAPER-04 (UNSOLVED)

PHYSICS (THEORY)

Time allowed: 3 hours  Maximum Marks: 70

General Instructions:

(a) All the questions are compulsory.
(b) There are 26 questions in total.
(c) Questions 1 to 5 are very short answer type questions and carry one mark each.
(d) Questions 6 to 10 carry two marks each.
(e) Questions 11 to 22 carry three marks each.
(f) Questions 23 is value based questions carry four marks.
(g) Questions 24 to 26 carry five marks each.
(h) There is no overall choice. However, an internal choice has been provided in one question of two marks, one question of three marks and all three questions in five marks each. You have to attempt only one of the choices in such questions.
(i) Use of calculators is not permitted. However, you may use log tables if necessary.
(j) You may use the following values of physical constants wherever necessary:
   \[ c = 3 \times 10^8 \text{ m/s} \]
   \[ h = 6.63 \times 10^{-34} \text{ Js} \]
   \[ e = 1.6 \times 10^{-19} \text{ C} \]
\[ \mu_0 = 4\pi \times 10^{-7} \text{TmA}^{-1} \]

\[ \frac{1}{4\pi\epsilon_0} = 9 \times 10^9 \text{Nm}^2\text{C}^{-2} \]

\[ m_e = 9.1 \times 10^{-31} \text{kg} \]

1. What is the K.E. per molecule of a gas whose pressure is P?
2. Give the dimensional formula for torque.
3. What is the specific heat of a gas in an isothermal process.
4. Draw velocity-time graph for an object, starting from rest. Acceleration is constant and remains positive.
5. Assume that the Young’s modulus of a wire of length L and radius r is Y, if the length is reduced to L/2 and radius r/2, then what will be its Young’s modulus?
6. There are two springs, one delicate and another hard or stout one. For which spring, the frequency of the oscillator will be more?
7. Find the height to which water at 4°C will rise in a capillary tube of 10^3 m diameter by taking angle of contact \( \theta = 0^\circ \) and T = 0.072 Nm\(^{-1}\)

Or

Why a hollow shaft is stronger than a solid shaft made from the same and equal amounts of materials?

8. If R be the horizontal range for inclination \( \theta \) and h be the maximum height reached by the projectile, show that maximum range is given by

\[ \frac{R^2}{8h} + 2h \]

9. A nucleus is at rest in the laboratory frame of reference, show that if it disintegrates into two smaller nuclei the products must move in opposite directions?

10. Suresh has to prove that a body projected in horizontal direction with a uniform velocity from top of tower follow parabola path. How would he prove?
11. Give two points of difference between elastic and inelastic collisions. Two balls A and B with A in motion initially and B at rest. Find their velocities after collision (perfectly elastic). Each ball is of mass “m”.  

\[ \text{A} \quad \text{v} \quad \text{B} \]

12. A liquid is in streamlined flow through a tube of non-uniform cross-section. Prove that sum of its kinetic energy, pressure energy and potential energy per unit volume remains constant.

13. Give reason :
   (i) fog particles appear suspended in atmosphere.
   (ii) two boats being moved parallel to each other attract.
   (iii) bridges are declared unsafe after long use.

14. State Kepler’s law of Planetary motion. Name the physical quantities which remain constant during the planetary motion.

15. What is the law of equipartition of energy? Determine the value of \( y \) for diatomic gas \( N_2 \) at moderate temperature.

16. Show that for small oscillations the motion of a simple pendulum is simple harmonic. Drive an expression for its time period. Does it depend on the mass of the bob?

OR

A SHM is described by \( y = r \sin \omega t \). What is :
   (i) the value of displacement \( y \) at which speed of the body executing SHM is half of the maximum speed?
   (ii) the time at which kinetic and potential energies are equally shared?

17. Find the scalar and vector products of two vectors.

\[ \vec{A} = 3\hat{i} - 4\hat{j} + 5\hat{k} \quad \text{and} \quad \vec{B} = -2\hat{i} + \hat{j} - 3\hat{k} \]
18. Obtain an expression for kinetic energy of rotation of a body with angular velocity \( \omega \) and hence define moment of inertia.

19. Discuss the variation of acceleration due to gravity ‘g’ by deriving correct mathematical expression with depth from the surface of Earth.
What is the value of ‘g’ at the centre of the Earth?

20. A particle starts from origin at \( t = 0 \) with a velocity \( 5.0 \, \mathbf{i} \, \text{m/s} \) and moves in xy plane under the action of a force which produces a constant acceleration of 
\[
(3.0 \, \mathbf{i} - 2.0 \, \mathbf{j}) \, \text{ms}^{-2}
\]
(i) What is the y-coordinate of the particles and the instant its x-coordinate is 84m?
(ii) What is the speed of the particle at this time?

21. Define surface energy of a liquid. How much work will be done in increasing the radius of a soap bubble from 1 cm to 5 cm (Surface tension = \( 73 \times 10^2 \, \text{N/m} \)).

22. What is an adiabatic process? Find an expression for the work done an adiabatic process.

23. A team of three friends Devendra, Durgesh and Patel were planning for tracking. They were sitting at Patel’s home which is on forth floor in the building. They were discussing about the low pressure of air on high altitude. Suddenly Patel said he was not feeling good. He felt some problem in breathing. Durgesh said that it is due to low density of air as we are on fourth floor. We should go to the ground floor as there would be good air density due to high value of gravity. But Devendra suggested that we should go to the doctor because density of air is not the problem. They rushed to doctor and he treated Patel.

(a) What values were displayed by Devendra?
(b) How can you explain that density of air not so affected by gravity on low altitude?
24. What is doppler effect? Derive an expression for the apparent frequency.
   (i) When source is in motion and observer is stationary.
   (ii) Observer is in motion and source is at rest.

   OR

   Find the total energy of a particle executing S.H.M. and show graphically the variation of potential energy and kinetic energy with displacement. A body is half kinetic and half potential.

   \( m \rightarrow \text{mass} \quad (i) \rightarrow \text{angular frequency} \quad \text{and} \quad a \rightarrow \text{amplitude}. \)

25. Define circular motion. Derive an expression for velocity and acceleration (centripetal) for a body executing uniform circular motion.

   OR

   What is a projectile? Show that the path of a projectile is parabolic. Obtain an expression for
   (i) maximum height
   (ii) Time of flight
   (iii) Horizontal range when the projectile is fired at an angle \( \theta \) with the horizontal.

26. State Parallelogram law of vector addition. Find the magnitude and direction of the resultant of two vectors \( A \) and \( B \) in terms of their magnitudes and angle between them.

   OR

   (i) Explain why it is easier to pull a roller than to push it.
   (ii) State Newton's laws of motion with at least one example of each. Show that Newton's second law is the real law.
CLASS - XI

SAMPLE PAPER-02 (UNSOLVED)

PHYSICS (THEORY)

Time allowed: 3 hours

Maximum Marks: 70

General Instructions:

(a) All the questions are compulsory.

(b) There are 26 questions in total.

(c) Questions 1 to 5 are very short answer type questions and carry one mark each.

(d) Questions 6 to 10 carry two marks each.

(e) Questions 11 to 22 carry three marks each.

(f) Questions 23 is value based questions carry four marks.

(g) Questions 24 to 26 carry five marks each.

(h) There is no overall choice. However, an internal choice has been provided in one question of two marks, one question of three marks and all three questions in five marks each. You have to attempt only one of the choices in such questions.

(i) Use of calculators is not permitted. However, you may use log tables if necessary.

(j) You may use the following values of physical constants wherever necessary:

\[ c = 3 \times 10^8 \text{ m/s} \]

\[ h = 6.63 \times 10^{-34} \text{Js} \]

\[ e = 1.6 \times 10^{-19} \text{C} \]
1. At which place on the earth the acceleration due to gravity is high?

2. What is the nature of force involved in the winding of a watch?

3. If a body falling from a height of 20 m rebounds from a hard floor, it loses 40% of its energy in impact. What is the height to which it would rise after the impact?

4. What provides the centripetal force in the following cases
   (a) Electron revolving around the nucleus
   (b) Earth revolving around the sun

5. If the absolute temperature of the gas is increased three times, then what will be the increase in r.m.s velocity of the gas molecules?

6. What will be its time of flight, if the object be projected at an angle \((90 - \theta)°\)? Assume that the time of flight of an object projected at an angle \(\theta\) is \(T\).

7. In the physics lab, the teacher asked students to find the diameter of a wire using screw gauge. Mala took four readings and finished her practicals whereas Kala took more than four readings.
   (a) What values do you associate with Mala and Kala?
   (b) Whose method of readings is correct?
   (c) Support your answer

8. A body of 2 kg is initially at rest Assuming that a constant force of 5 N acts on it for 10 s, calculate the average power of the same.

9. If two soap bubbles in vacuum having radii 3 cm and 4 cm coalesce under isothermal conditions to form a single bubble, then what is the radius of the new bubble?
If Young’s modulus is \( E \), find the force with which the steel ring is expanded. Assume that a steel ring of radius \( r \) and cross-section area \( A \) is fitted onto a wooden disc of radius \( R \).

10. Prove: The third equation of rotational motion \( \omega^2 - \omega_0^2 = 2\alpha \theta \)

11. A body moving with uniform acceleration describes 12 m in 3\(^{rd}\) second of its motion and 20 m in the 5\(^{th}\) second. Find the velocity after 10 seconds?

12. Why does a person sitting in one train think that the other train is at rest, when both the trains are moving on parallel tracks with the same speed and in the same direction?

13. A group of friends went to circus where they saw a biker riding a motorcycle in a big ball of iron in all directions. After the show, they went to the biker and told that they were amazed of his performance and asked him how he did not fall down.

(a) What is the minimum speed at lowest and highest point if a motorcyclist loops in a vertical loop of diameter 50 m without dropping down even at the uppermost point?

(b) the net force on the body of mass ‘m’ tied to one end of string which is revolved in vertical circle of at the lowest \( F_{\text{low}} \) and highest \( F_{\text{high}} \) point of the circle directed vertically downward.

14. Given the example of the motion in the following cases:

(i) Where magnitude and direction of the acceleration of the particle changes

(ii) Where the magnitude ad direction of the acceleration of body remains constant

(iii) Where the magnitude of acceleration changes but its direction remains constants

(iv) Where the magnitudes of acceleration remain constant but its direction changes

Or
Find at what temperature the velocity of sound in air will be \( \frac{1}{2} \) times the velocity at 11°C.

15. If the volume of the air bubble increases 15 times when it rises from bottom to the top of the lake, then calculate the depth of the lake by assuming the density of lake water to be 1.02 \( \times \) 10\(^3\) kg/m\(^3\) and atmospheric pressure to be 75 cm of mercury.

16. A particle of 10 kg mass is moving in a circle of 4m radius with constant speed of 5 m/sec. What is the angular momentum about the centre of circle and a point on the axis of the circle and 3 m distant from its centre?

17. A simple harmonic motion has an amplitude and time period T. What is the time taken to travel from \( x = A \) to \( x = \frac{A}{2} \)?

18. A. Explain Doppler Effect in sound.

   B. Deduce an expression for apparent frequency of sound when source and listener are approaching each other.

19. Equal torque is applied on a cylinder and a sphere has same mass and radius. The cylinder rotates about its axis and die sphere rotates about one of its diameters. Which will acquire greater speed? Explain why?

20. A body is projected with a velocity of 30 m/s at an angle of 30° to the horizontal direction. Find:
   
   i. Maximum height
   
   ii. Time of flight
   
   iii. The horizontal range (Take \( g = 10 \) m/s\(^2\))

21. When two moles of an ideal monoatomic gas occupy a volume \( V \) at 137°C, the gas expands adiabatically to a volume 2\( V \). Calculate
   
   (a) Final temperature of gas.
   
   (b) Change in its internal energy
   
   (c) Work done by the gas during the process.
   
   [Given: \( \gamma = 5/3 \)]
22. If the volume of a metal sphere is 1000 cm\(^3\) at 273 K and the coefficient of linear expansion of the metal is \(18 \times 10^{-6}\) K\(^{-1}\), then what would be its volume at 373 K?

23. Sarah saw a baby of two years was trying to get into the dining table from the mother's hold where a jug of boiling water has been kept. The baby tried to jump and Sarah saw the baby jump removed the jar aside.
   (a) Give reason: “Steam causes more severe burn than boiling water”.
   (b) What values of Sarah are appreciable?
   (c) If at atmospheric pressure, 4 g of water having volume of 4.00 cm\(^3\) becomes 6684 cm\(^3\) of steam when boiled, then find the amount of heat added to the system? [Latent heat of vapourisation of water is 539 cal/g at 1 arm]

24. A body covers 400 cm in the first 4 seconds and 440 cm in the next two seconds.
   (a) What will be its velocity at the end of 14 seconds?
   (b) Find the displacement in 14 seconds.

   Or
   
   Show that for a projectile the angle between the velocity and the x-axis as a function of time is given by
   
   \[
   \theta(t) = \tan^{-1}\left(\frac{v_{vy} - gt}{v_{vx}}\right)
   \]

25. State and prove Bernoulli’s Theorem. Explain the following:
   (i) Can Bernoulli’s equation be used to describe the flow of water through a rapid river?
   (ii) Does it matter if one uses gauge pressure instead of absolute pressure by applying Bernoulli’s equation.

   OR

   (i) What is the phenomenon of capillarity? Derive an expression for the size of liquid in a capillary tube.
(ii) What will happen if the length of the capillary tube is smaller than the height to which the liquid rises? Explain briefly.

26. A progressive wave is given by $y(x, t) = 8 \cos(300t - 0.15x)$. Where $x$ in metre $y$ in cm and $t$ in second. What is the

(i) direction of propagation
(ii) wavelength
(iii) frequency
(iv) wave speed
(v) phase difference between two points 0.2 in apart?

OR

Give any three differences between progressive waves and stationary waves. A stationary wave is $y = 12 \sin 300t \cos 2x$. What is the distance between two nearest nodes.
